

SeleniumLibrary

Library version: 4.5.0rc2
Library scope: GLOBAL
Named arguments: supported

Introduction

SeleniumLibrary is a web testing library for Robot Framework.

This document explains how to use keywords provided by SeleniumLibrary. For information about installation, support, and more, please visit the [project pages](#). For more information about Robot Framework, see <http://robotframework.org>.

SeleniumLibrary uses the Selenium WebDriver modules internally to control a web browser. See <http://seleniumhq.org> for more information about Selenium in general and SeleniumLibrary README.rst [Browser drivers chapter](#) for more details about WebDriver binary installation.

Locating elements

All keywords in SeleniumLibrary that need to interact with an element on a web page take an argument typically named `locator` that specifies how to find the element. Most often the locator is given as a string using the locator syntax described below, but [using WebElements](#) is possible too.

Locator syntax

SeleniumLibrary supports finding elements based on different strategies such as the element id, XPath expressions, or CSS selectors. The strategy can either be explicitly specified with a prefix or the strategy can be implicit.

Default locator strategy

By default, locators are considered to use the keyword specific default locator strategy. All keywords support finding elements based on `id` and `name` attributes, but some keywords support additional attributes or other values that make sense in their context. For example, [Click Link](#) supports the `href` attribute and the link text and addition to the normal `id` and `name`.

Examples:

Click Element	example	# Match based on <code>id</code> or <code>name</code> .
Click Link	example	# Match also based on link text and <code>href</code> .
Click Button	example	# Match based on <code>id</code> , <code>name</code> or <code>value</code> .

If a locator accidentally starts with a prefix recognized as [explicit locator strategy](#) or [implicit XPath strategy](#), it is possible to use the explicit `default` prefix to enable the default strategy.

Examples:

Click Element	name:foo	# Find element with name <code>foo</code> .
Click Element	default:name:foo	# Use default strategy with value <code>name:foo</code> .
Click Element	//foo	# Find element using XPath <code>//foo</code> .
Click Element	default://foo	# Use default strategy with value <code>//foo</code> .

Explicit locator strategy

The explicit locator strategy is specified with a prefix using either syntax `strategy:value` or `strategy=value`. The former syntax is preferred because the latter is identical to Robot Framework's [named argument syntax](#) and that can cause problems. Spaces around the separator are ignored, so `id:foo`, `id: foo` and `id :foo` are all equivalent.

Locator strategies that are supported by default are listed in the table below. In addition to them, it is possible to register [custom locators](#).

Strategy	Match based on	Example
id	Element <code>id</code> .	<code>id:example</code>
name	<code>name</code> attribute.	<code>name:example</code>
identifier	Either <code>id</code> or <code>name</code> .	<code>identifier:example</code>
class	Element <code>class</code> .	<code>class:example</code>
tag	Tag name.	<code>tag:div</code>
xpath	XPath expression.	<code>xpath://div[@id="example"]</code>
css	CSS selector.	<code>css:div#example</code>
dom	DOM expression.	<code>dom:document.images[5]</code>
link	Exact text a link has.	<code>link:The example</code>
partial link	Partial link text.	<code>partial link:he ex</code>
sizzle	Sizzle selector deprecated.	<code>sizzle:div.example</code>
jquery	jQuery expression.	<code>jquery:div.example</code>
default	Keyword specific default behavior.	<code>default:example</code>

See the [Default locator strategy](#) section below for more information about how the default strategy works. Using the explicit `default` prefix is only necessary if the locator value itself accidentally matches some of the explicit strategies.

Different locator strategies have different pros and cons. Using ids, either explicitly like `id:foo` or by using the [default locator strategy](#) simply like `foo`, is recommended when possible, because the syntax is simple and locating elements by id is fast for browsers. If an element does not have an id or the id is not stable, other solutions need to be used. If an element has a unique tag name or class, using `tag`, `class` or `css` strategy like `tag:h1`, `class:example` or `css:h1.example` is often an easy solution. In more complex cases using XPath expressions is typically the best approach. They are very powerful but a downside is that they can also get complex.

Examples:

<i>Click Element</i>	id:foo	# Element with id 'foo'.
<i>Click Element</i>	css:div#foo h1	# h1 element under div with id 'foo'.
<i>Click Element</i>	xpath: //div[@id="foo"]//h1	# Same as the above using XPath, not CSS.
<i>Click Element</i>	xpath: //*[contains(text(), "example")]	# Element containing text 'example'.

NOTE:

- The `strategy:value` syntax is only supported by SeleniumLibrary 3.0 and newer.
- Using the `sizzle` strategy or its alias `jquery` requires that the system under test contains the jQuery library.
- Prior to SeleniumLibrary 3.0, table related keywords only supported `xpath`, `css` and `sizzle/jquery` strategies.

Implicit XPath strategy

If the locator starts with `//` or `(//`, the locator is considered to be an XPath expression. In other words, using `//div` is equivalent to using explicit `xpath://div`.

Examples:

<i>Click Element</i>	//div[@id="foo"]//h1
<i>Click Element</i>	(//div)[2]

The support for the `(//` prefix is new in SeleniumLibrary 3.0.

Using WebElements

In addition to specifying a locator as a string, it is possible to use Selenium's WebElement objects. This requires first getting a WebElement, for example, by using the *Get WebElement* keyword.

<code>\${elem} =</code>	<i>Get WebElement</i>	id:example
<i>Click Element</i>	<code>\${elem}</code>	

Custom locators

If more complex lookups are required than what is provided through the default locators, custom lookup strategies can be created. Using custom locators is a two part process. First, create a keyword that returns a WebElement that should be acted on:

Custom Locator Strategy	[Arguments]	<code>\${browser}</code>	<code>\${locator}</code>	<code>\${tag}</code>	<code>\${constraints}</code>
	<code>\${element} =</code>	Execute Javascript	<code>return window.document.getElementById('\${locator}');</code>		
	[Return]	<code>\${element}</code>			

This keyword is a reimplement of the basic functionality of the `id` locator where `${browser}` is a reference to a WebDriver instance and `${locator}` is the name of the locator strategy. To use this locator, it must first be registered by using the *Add Location Strategy* keyword:

<i>Add Location Strategy</i>	custom	Custom Locator Strategy
------------------------------	--------	-------------------------

The first argument of *Add Location Strategy* specifies the name of the strategy and it must be unique. After registering the strategy, the usage is the same as with other locators:

<i>Click Element</i>	custom:example
----------------------	----------------

See the *Add Location Strategy* keyword for more details.

Browser and Window

There is different conceptual meaning when SeleniumLibrary talks about windows or browsers. This chapter explains those differences.

Browser

When *Open Browser* or *Create WebDriver* keyword is called, it will create a new Selenium WebDriver instance by using the *Selenium WebDriver* API. In SeleniumLibrary terms, a new browser is created. It is possible to start multiple independent browsers (Selenium Webdriver instances) at the same time, by calling *Open Browser* or *Create WebDriver* multiple times. These browsers are usually independent of each other and do not share data like cookies, sessions or profiles. Typically when the browser starts, it creates a single window which is shown to the user.

Window

Windows are the part of a browser that loads the web site and presents it to the user. All content of the site is the content of the window. Windows are children of a browser. In SeleniumLibrary browser is a synonym for WebDriver instance. One browser may have multiple windows. Windows can appear as tabs, as separate windows or pop-ups with different position and size. Windows belonging to the same browser typically share the sessions detail, like cookies. If there is a need to separate sessions detail, example login with two different users, two browsers (Selenium WebDriver instances) must be created. New windows can be opened example by the application under test or by example *Execute Javascript* keyword:

```
Execute Javascript    window.open()    # Opens a new window with location about:blank
```

The example below opens multiple browsers and windows, to demonstrate how the different keywords can be used to interact with browsers, and windows attached to these browsers.

Structure:

```
BrowserA
    Window 1  (location=https://robotframework.org/)
    Window 2  (location=https://robocon.io/)
    Window 3  (location=https://github.com/robotframework/)

BrowserB
    Window 1  (location=https://github.com/)
```

Example:

<i>Open Browser</i>	https://robotframework.org	<code>\${BROWSER}</code>	alias=BrowserA	# BrowserA with first window is opened.
<i>Execute Javascript</i>	<code>window.open()</code>			# In BrowserA second window is opened.
<i>Switch Window</i>	locator=NEW			# Switched to second window in BrowserA
<i>Go To</i>	https://robocon.io			# Second window navigates to robocon site.
<i>Execute Javascript</i>	<code>window.open()</code>			# In BrowserA third window is opened.
<code>\${handle}</code>	<i>Switch Window</i>	locator=NEW		# Switched to third window in BrowserA
<i>Go To</i>	https://github.com/robotframework/			# Third windows goes to robot framework github site.
<i>Open Browser</i>	https://github.com	<code>\${BROWSER}</code>	alias=BrowserB	# BrowserB with first windows is opened.
<code>\${location}</code>	<i>Get Location</i>			# <code>\${location}</code> is: https://www.github.com
<i>Switch Window</i>	<code>\${handle}</code>	browser=BrowserA		# BrowserA second windows is selected.
<code>\${location}</code>	<i>Get Location</i>			# <code>\${location}</code> = https://robocon.io/
<code>@{locations 1}</code>	<i>Get Locations</i>			# By default, lists locations under the currently active browser (BrowserA).
<code>@{locations 2}</code>	<i>Get Locations</i>	browser=ALL		# By using browser=ALL argument keyword list all locations from all browsers.

The above example, @locations 1 contains the following items: <https://robotframework.org/>, <https://robocon.io/> and <https://github.com/robotframework/>'. The @locations 2 contains the following items: <https://robotframework.org/>, <https://robocon.io/>, <https://github.com/robotframework/>' and <https://github.com/>.

Timeouts, waits, and delays

This section discusses different ways how to wait for elements to appear on web pages and to slow down execution speed otherwise. It also explains the *time format* that can be used when setting various timeouts, waits, and delays.

Timeout

SeleniumLibrary contains various keywords that have an optional `timeout` argument that specifies how long these keywords should wait for certain events or actions. These keywords include, for example, `Wait ...` keywords and keywords related to alerts. Additionally *Execute Async Javascript*. Although it does not have `timeout` argument, uses a timeout to define how long asynchronous JavaScript can run.

The default timeout these keywords use can be set globally either by using the *Set Selenium Timeout* keyword or with the `timeout` argument when *importing* the library. See *time format* below for supported timeout syntax.

Implicit wait

Implicit wait specifies the maximum time how long Selenium waits when searching for elements. It can be set by using the *Set Selenium Implicit Wait* keyword or with the `implicit_wait` argument when *importing* the library. See *Selenium documentation* for more information about this functionality.

See *time format* below for supported syntax.

Selenium speed

Selenium execution speed can be slowed down globally by using *Set Selenium speed* keyword. This functionality is designed to be used for demonstrating or debugging purposes. Using it to make sure that elements appear on a page is not a good idea. The above-explained timeouts and waits should be used instead.

See *time format* below for supported syntax.

Time format

All timeouts and waits can be given as numbers considered seconds (e.g. `0.5` or `42`) or in Robot Framework's time syntax (e.g. `1.5 seconds` or `1 min 30 s`). For more information about the time syntax see the *Robot Framework User Guide*.

Run-on-failure functionality

SeleniumLibrary has a handy feature that it can automatically execute a keyword if any of its own keywords fails. By default, it uses the *Capture Page Screenshot* keyword, but this can be changed either by using the *Register Keyword To Run On Failure* keyword or with the `run_on_failure` argument when *importing* the library. It is possible to use any keyword from any imported library or resource file.

The run-on-failure functionality can be disabled by using a special value `NOTHING` or anything considered false (see *Boolean arguments*) such as `NONE`.

Boolean arguments

Some keywords accept arguments that are handled as Boolean values true or false. If such an argument is given as a string, it is considered false if it is either empty or case-insensitively equal to `false`, `no`, `off`, `0` or `none`. Other strings are considered true regardless of their value and other argument types are tested using the same *rules as in Python*.

True examples:

<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=True</code>	# Strings are generally true.
<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=yes</code>	# Same as the above.
<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=\${TRUE}</code>	# Python True is true.
<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=\${42}</code>	# Numbers other than 0 are true.

False examples:

<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=False</code>	# String false is false.
<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=no</code>	# Also string no is false.
<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=NONE</code>	# String NONE is false.
<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=\${EMPTY}</code>	# Empty string is false.
<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=\${FALSE}</code>	# Python False is false.
<i>Set Screenshot Directory</i>	<code>\${RESULTS}</code>	<code>persist=\${NONE}</code>	# Python None is false.

Note that prior to SeleniumLibrary 3.0, all non-empty strings, including `false`, `no` and `none`, were considered true. Starting from SeleniumLibrary 4.0, strings `0` and `off` are considered as false.

EventFiringWebDriver

The SeleniumLibrary offers support for *EventFiringWebDriver*. See the Selenium and SeleniumLibrary *EventFiringWebDriver support* documentation for further details.

EventFiringWebDriver is new in SeleniumLibrary 4.0

Thread support

SeleniumLibrary is not thread-safe. This is mainly due because the underlying *Selenium tool is not thread-safe* within one browser/driver instance. Because of the limitation in the Selenium side, the keywords or the API provided by the SeleniumLibrary is not thread-safe.

Plugins

SeleniumLibrary offers plugins as a way to modify and add library keywords and modify some of the internal functionality without creating a new library or hacking the source code. See *plugin API* documentation for further details.

Plugin API is new SeleniumLibrary 4.0

Importing

Arguments	Documentation
<code>timeout=5.0</code> , <code>implicit_wait=0.0</code> , <code>run_on_failure=Capture Page Screenshot</code> , <code>screenshot_root_directory=None</code> , <code>plugins=None</code> , <code>event_firing_webdriver=None</code>	<p>SeleniumLibrary can be imported with several optional arguments.</p> <ul style="list-style-type: none"><code>timeout</code>: Default value for <i>timeouts</i> used with <code>Wait ...</code> keywords.<code>implicit_wait</code>: Default value for <i>implicit wait</i> used when locating elements.<code>run_on_failure</code>: Default action for the <i>run-on-failure functionality</i>.<code>screenshot_root_directory</code>: Path to folder where possible screenshots are created or EMBED. See <i>Set Screenshot Directory</i> keyword for further details about EMBED. If not given, the directory where the log file is written is used.

Keywords

Keyword	Arguments	Documentation																				
Add Cookie	<i>name, value, path=None, domain=None, secure=None, expiry=None</i>	<p>Adds a cookie to your current session.</p> <p><code>name</code> and <code>value</code> are required, <code>path</code>, <code>domain</code>, <code>secure</code> and <code>expiry</code> are optional. Expiry supports the same formats as the DateTime library or an epoch timestamp.</p> <p>Example:</p> <table><tr><td>Add Cookie</td><td>foo</td><td>bar</td><td></td><td></td></tr><tr><td>Add Cookie</td><td>foo</td><td>bar</td><td>domain=example.com</td><td></td></tr><tr><td>Add Cookie</td><td>foo</td><td>bar</td><td>expiry=2027-09-28 16:21:35</td><td># Expiry as timestamp.</td></tr><tr><td>Add Cookie</td><td>foo</td><td>bar</td><td>expiry=1822137695</td><td># Expiry as epoch seconds.</td></tr></table> <p>Prior to SeleniumLibrary 3.0 setting expiry did not work.</p>	Add Cookie	foo	bar			Add Cookie	foo	bar	domain=example.com		Add Cookie	foo	bar	expiry=2027-09-28 16:21:35	# Expiry as timestamp.	Add Cookie	foo	bar	expiry=1822137695	# Expiry as epoch seconds.
Add Cookie	foo	bar																				
Add Cookie	foo	bar	domain=example.com																			
Add Cookie	foo	bar	expiry=2027-09-28 16:21:35	# Expiry as timestamp.																		
Add Cookie	foo	bar	expiry=1822137695	# Expiry as epoch seconds.																		
Add Location Strategy	<i>strategy_name, strategy_keyword, persist=False</i>	<p>Adds a custom location strategy.</p> <p>See Custom locators for information on how to create and use custom strategies. Remove Location Strategy can be used to remove a registered strategy.</p> <p>Location strategies are automatically removed after leaving the current scope by default. Setting <code>persist</code> to a true value (see Boolean arguments) will cause the location strategy to stay registered throughout the life of the test.</p>																				
Alert Should Be Present	<i>text=, action=ACCEPT, timeout=None</i>	<p>Verifies that an alert is present and by default, accepts it.</p> <p>Fails if no alert is present. If <code>text</code> is a non-empty string, then it is used to verify alert's message. The alert is accepted by default, but that behavior can be controlled by using the <code>action</code> argument same way as with Handle Alert.</p> <p><code>timeout</code> specifies how long to wait for the alert to appear. If it is not given, the global default timeout is used instead.</p> <p><code>action</code> and <code>timeout</code> arguments are new in SeleniumLibrary 3.0. In earlier versions, the alert was always accepted and a timeout was hardcoded to one second.</p>																				
Alert Should Not Be Present	<i>action=ACCEPT, timeout=0</i>	<p>Verifies that no alert is present.</p> <p>If the alert actually exists, the <code>action</code> argument determines how it should be handled. By default, the alert is accepted, but it can be also dismissed or left open the same way as with the Handle Alert keyword.</p> <p><code>timeout</code> specifies how long to wait for the alert to appear. By default, is not waited for the alert at all, but a custom time can be given if alert may be delayed. See the time format section for information about the syntax.</p> <p>New in SeleniumLibrary 3.0.</p>																				
Assign Id To Element	<i>locator, id</i>	<p>Assigns a temporary <code>id</code> to the element specified by <code>locator</code>.</p> <p>This is mainly useful if the locator is complicated and/or slow XPath expression and it is needed multiple times. Identifier expires when the page is reloaded.</p> <p>See the Locating elements section for details about the locator syntax.</p> <p>Example:</p> <table><tr><td>Assign ID to Element</td><td>//ul[@class='example' and .li[contains(., 'Stuff')]]</td><td>my id</td></tr><tr><td>Page Should Contain Element</td><td>my id</td><td></td></tr></table>	Assign ID to Element	//ul[@class='example' and .li[contains(., 'Stuff')]]	my id	Page Should Contain Element	my id															
Assign ID to Element	//ul[@class='example' and .li[contains(., 'Stuff')]]	my id																				
Page Should Contain Element	my id																					
Capture Element Screenshot	<i>locator, filename=selenium-element-screenshot-{index}.png</i>	<p>Captures a screenshot from the element identified by <code>locator</code> and embeds it into log file.</p> <p>See Capture Page Screenshot for details about <code>filename</code> argument. See the Locating elements section for details about the locator syntax.</p> <p>An absolute path to the created element screenshot is returned.</p> <p>Support for capturing the screenshot from an element has limited support among browser vendors. Please check the browser vendor driver documentation does the browser support capturing a screenshot from an element.</p> <p>New in SeleniumLibrary 3.3. Support for EMBED is new in SeleniumLibrary 4.2.</p> <p>Examples:</p>																				

		<table><tr><td>Capture Element Screenshot</td><td>id:image_id</td><td></td></tr><tr><td>Capture Element Screenshot</td><td>id:image_id</td><td>\${OUTPUTDIR}/id_image_id-1.png</td></tr><tr><td>Capture Element Screenshot</td><td>id:image_id</td><td>EMBED</td></tr></table>	Capture Element Screenshot	id:image_id		Capture Element Screenshot	id:image_id	\${OUTPUTDIR}/id_image_id-1.png	Capture Element Screenshot	id:image_id	EMBED																	
Capture Element Screenshot	id:image_id																											
Capture Element Screenshot	id:image_id	\${OUTPUTDIR}/id_image_id-1.png																										
Capture Element Screenshot	id:image_id	EMBED																										
Capture Page Screenshot	filename=selenium-screenshot-{index}.png	<p>Takes a screenshot of the current page and embeds it into a log file.</p> <p><code>filename</code> argument specifies the name of the file to write the screenshot into. The directory where screenshots are saved can be set when <i>importing</i> the library or by using the <i>Set Screenshot Directory</i> keyword. If the directory is not configured, screenshots are saved to the same directory where Robot Framework's log file is written.</p> <p>If <code>filename</code> equals to EMBED (case insensitive), then screenshot is embedded as Base64 image to the log.html. In this case file is not created in the filesystem.</p> <p>Starting from SeleniumLibrary 1.8, if <code>filename</code> contains marker <code>{index}</code>, it will be automatically replaced with an unique running index, preventing files to be overwritten. Indices start from 1, and how they are represented can be customized using Python's <i>format string syntax</i>.</p> <p>An absolute path to the created screenshot file is returned or if <code>filename</code> equals to EMBED, word <i>EMBED</i> is returned.</p> <p>Support for EMBED is new in SeleniumLibrary 4.2</p> <p>Examples:</p> <table><tr><td>Capture Page Screenshot</td><td></td></tr><tr><td>File Should Exist</td><td>\${OUTPUTDIR}/selenium-screenshot-1.png</td></tr><tr><td>\$(path) =</td><td>Capture Page Screenshot</td></tr><tr><td>File Should Exist</td><td>\${OUTPUTDIR}/selenium-screenshot-2.png</td></tr><tr><td>File Should Exist</td><td>\$(path)</td></tr><tr><td>Capture Page Screenshot</td><td>custom_name.png</td></tr><tr><td>File Should Exist</td><td>\${OUTPUTDIR}/custom_name.png</td></tr><tr><td>Capture Page Screenshot</td><td>custom_with_index_{index}.png</td></tr><tr><td>File Should Exist</td><td>\${OUTPUTDIR}/custom_with_index_1.png</td></tr><tr><td>Capture Page Screenshot</td><td>formatted_index_{index:03}.png</td></tr><tr><td>File Should Exist</td><td>\${OUTPUTDIR}/formatted_index_001.png</td></tr><tr><td>Capture Page Screenshot</td><td>EMBED</td></tr><tr><td>File Should Not Exist</td><td>EMBED</td></tr></table>	Capture Page Screenshot		File Should Exist	\${OUTPUTDIR}/selenium-screenshot-1.png	\$(path) =	Capture Page Screenshot	File Should Exist	\${OUTPUTDIR}/selenium-screenshot-2.png	File Should Exist	\$(path)	Capture Page Screenshot	custom_name.png	File Should Exist	\${OUTPUTDIR}/custom_name.png	Capture Page Screenshot	custom_with_index_{index}.png	File Should Exist	\${OUTPUTDIR}/custom_with_index_1.png	Capture Page Screenshot	formatted_index_{index:03}.png	File Should Exist	\${OUTPUTDIR}/formatted_index_001.png	Capture Page Screenshot	EMBED	File Should Not Exist	EMBED
Capture Page Screenshot																												
File Should Exist	\${OUTPUTDIR}/selenium-screenshot-1.png																											
\$(path) =	Capture Page Screenshot																											
File Should Exist	\${OUTPUTDIR}/selenium-screenshot-2.png																											
File Should Exist	\$(path)

File Should Not Exist	EMBED																											
Checkbox Should Be Selected	locator	<p>Verifies checkbox <code>locator</code> is selected/checked.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																										
Checkbox Should Not Be Selected	locator	<p>Verifies checkbox <code>locator</code> is not selected/checked.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																										
Choose File	locator, file_path	<p>Inputs the <code>file_path</code> into the file input field <code>locator</code>.</p> <p>This keyword is most often used to input files into upload forms. The keyword does not check <code>file_path</code> is the file or folder available on the machine where tests are executed. If the <code>file_path</code> points at a file and when using Selenium Grid, Selenium will <i>magically</i>, transfer the file from the machine where the tests are executed to the Selenium Grid node where the browser is running. Then Selenium will send the file path, from the nodes file system, to the browser.</p> <p>That <code>file_path</code> is not checked, is new in SeleniumLibrary 4.0.</p> <p>Example:</p> <table><tr><td>Choose File</td><td>my_upload_field</td><td>\${CURDIR}/trades.csv</td></tr></table>	Choose File	my_upload_field	\${CURDIR}/trades.csv																							
Choose File	my_upload_field	\${CURDIR}/trades.csv																										
Clear Element Text	locator	<p>Clears the value of the text-input-element identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																										
Click Button	locator, modifier=False	<p>Clicks the button identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax. When using the default locator strategy, buttons are searched using <code>id</code>, <code>name</code>, and <code>value</code>.</p> <p>See the <i>Click Element</i> keyword for details about the <code>modifier</code> argument.</p> <p>The <code>modifier</code> argument is new in SeleniumLibrary 3.3</p>																										
Click Element	locator, modifier=False, action_chain=False	<p>Click the element identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>The <code>modifier</code> argument can be used to pass <i>Selenium Keys</i> when clicking the element. The <code>+</code> can be used as a separator for different Selenium Keys. The <i>CTRL</i> is internally translated to the <i>CONTROL</i> key. The <code>modifier</code> is space and case insensitive, example "alt" and "aLt" are supported formats to <i>ALT key</i>. If <code>modifier</code> does not match to Selenium Keys, keyword fails.</p> <p>If <code>action_chain</code> argument is true, see <i>Boolean arguments</i> for more details on how to set boolean argument, then keyword uses ActionChain based click instead of the <code><web_element>.click()</code> function. If both <code>action_chain</code> and <code>modifier</code> are defined, the click will be performed using <code>modifier</code> and <code>action_chain</code> will be ignored.</p> <p>Example:</p> <table><tr><td>Click Element</td><td>id:button</td><td></td><td># Would click element without any modifiers.</td></tr><tr><td>Click Element</td><td>id:button</td><td>CTRL</td><td># Would click element with CTRL key pressed down.</td></tr><tr><td>Click Element</td><td>id:button</td><td>CTRL+ALT</td><td># Would click element with CTRL and ALT keys pressed down.</td></tr><tr><td>Click Element</td><td>id:button</td><td>action_chain=True</td><td># Clicks the button using an Selenium ActionChains</td></tr></table> <p>The <code>modifier</code> argument is new in SeleniumLibrary 3.2 The <code>action_chain</code> argument is new in SeleniumLibrary 4.1</p>	Click Element	id:button		# Would click element without any modifiers.	Click Element	id:button	CTRL	# Would click element with CTRL key pressed down.	Click Element	id:button	CTRL+ALT	# Would click element with CTRL and ALT keys pressed down.	Click Element	id:button	action_chain=True	# Clicks the button using an Selenium ActionChains										
Click Element	id:button		# Would click element without any modifiers.																									
Click Element	id:button	CTRL	# Would click element with CTRL key pressed down.																									
Click Element	id:button	CTRL+ALT	# Would click element with CTRL and ALT keys pressed down.																									
Click Element	id:button	action_chain=True	# Clicks the button using an Selenium ActionChains																									
Click Element At Coordinates	locator, xoffset, yoffset	<p>Click the element <code>locator</code> at <code>xoffset/yoffset</code>.</p> <p>The Cursor is moved and the center of the element and x/y coordinates are calculated from that point.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																										
Click Image	locator, modifier=False	<p>Clicks an image identified by <code>locator</code>.</p>																										

		<p>See the <i>Locating elements</i> section for details about the locator syntax. When using the default locator strategy, images are searched using <code>id</code>, <code>name</code>, <code>src</code> and <code>alt</code>.</p> <p>See the <i>Click Element</i> keyword for details about the <code>modifier</code> argument.</p> <p>The <code>modifier</code> argument is new in SeleniumLibrary 3.3</p>																												
Click Link	<i>locator, modifier=False</i>	<p>Clicks a link identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax. When using the default locator strategy, links are searched using <code>id</code>, <code>name</code>, <code>href</code> and the link text.</p> <p>See the <i>Click Element</i> keyword for details about the <code>modifier</code> argument.</p> <p>The <code>modifier</code> argument is new in SeleniumLibrary 3.3</p>																												
Close All Browsers		<p>Closes all open browsers and resets the browser cache.</p> <p>After this keyword, new indexes returned from <i>Open Browser</i> keyword are reset to 1.</p> <p>This keyword should be used in test or suite teardown to make sure all browsers are closed.</p>																												
Close Browser		Closes the current browser.																												
Close Window		Closes currently opened and selected browser window/tab.																												
Cover Element	<i>locator</i>	<p>Will cover elements identified by <code>locator</code> with a blue div without breaking page layout.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>New in SeleniumLibrary 3.3.0</p> <p>Example: <code> Cover Element css:div#container </code></p>																												
Create Webdriver	<i>driver_name, alias=None, kwargs={}, **init_kwargs</i>	<p>Creates an instance of Selenium WebDriver.</p> <p>Like <i>Open Browser</i>, but allows passing arguments to the created WebDriver instance directly. This keyword should only be used if the functionality provided by <i>Open Browser</i> is not adequate.</p> <p><code>driver_name</code> must be a WebDriver implementation name like Firefox, Chrome, Ie, Opera, Safari, PhantomJS, or Remote.</p> <p>The initialized WebDriver can be configured either with a Python dictionary <code>kwargs</code> or by using keyword arguments <code>**init_kwargs</code>. These arguments are passed directly to WebDriver without any processing. See <i>Selenium API documentation</i> for details about the supported arguments.</p> <p>Examples:</p> <table><tr><td># Use proxy with Firefox</td><td></td><td></td><td></td></tr><tr><td><code>\$(proxy)=</code></td><td><i>Evaluate</i></td><td><code>selenium.webdriver.Proxy()</code></td><td><code>modules=selenium, selenium.webdriver</code></td></tr><tr><td><code>\$(proxy.http_proxy)=</code></td><td><i>Set Variable</i></td><td><code>localhost:8888</code></td><td></td></tr><tr><td><i>Create Webdriver</i></td><td>Firefox</td><td><code>proxy=\$(proxy)</code></td><td></td></tr><tr><td># Use proxy with PhantomJS</td><td></td><td></td><td></td></tr><tr><td><code>\$(service args)=</code></td><td><i>Create List</i></td><td><code>--proxy=192.168.132.104:8888</code></td><td></td></tr><tr><td><i>Create Webdriver</i></td><td>PhantomJS</td><td><code>service_args=\$(service args)</code></td><td></td></tr></table> <p>Returns the index of this browser instance which can be used later to switch back to it. Index starts from 1 and is reset back to it when <i>Close All Browsers</i> keyword is used. See <i>Switch Browser</i> for an example.</p>	# Use proxy with Firefox				<code>\$(proxy)=</code>	<i>Evaluate</i>	<code>selenium.webdriver.Proxy()</code>	<code>modules=selenium, selenium.webdriver</code>	<code>\$(proxy.http_proxy)=</code>	<i>Set Variable</i>	<code>localhost:8888</code>		<i>Create Webdriver</i>	Firefox	<code>proxy=\$(proxy)</code>		# Use proxy with PhantomJS				<code>\$(service args)=</code>	<i>Create List</i>	<code>--proxy=192.168.132.104:8888</code>		<i>Create Webdriver</i>	PhantomJS	<code>service_args=\$(service args)</code>	
# Use proxy with Firefox																														
<code>\$(proxy)=</code>	<i>Evaluate</i>	<code>selenium.webdriver.Proxy()</code>	<code>modules=selenium, selenium.webdriver</code>																											
<code>\$(proxy.http_proxy)=</code>	<i>Set Variable</i>	<code>localhost:8888</code>																												
<i>Create Webdriver</i>	Firefox	<code>proxy=\$(proxy)</code>																												
# Use proxy with PhantomJS																														
<code>\$(service args)=</code>	<i>Create List</i>	<code>--proxy=192.168.132.104:8888</code>																												
<i>Create Webdriver</i>	PhantomJS	<code>service_args=\$(service args)</code>																												
Current Frame Should Contain	<i>text, loglevel=TRACE</i>	<p>Verifies that the current frame contains <code>text</code>.</p> <p>See <i>Page Should Contain</i> for an explanation about the <code>loglevel</code> argument.</p> <p>Prior to SeleniumLibrary 3.0 this keyword was named <i>Current Frame Contains</i>.</p>																												
Current Frame Should Not Contain	<i>text, loglevel=TRACE</i>	<p>Verifies that the current frame does not contain <code>text</code>.</p> <p>See <i>Page Should Contain</i> for an explanation about the <code>loglevel</code> argument.</p>																												
Delete All Cookies		Deletes all cookies.																												
Delete Cookie	<i>name</i>	<p>Deletes the cookie matching <code>name</code>.</p> <p>If the cookie is not found, nothing happens.</p>																												
Double Click Element	<i>locator</i>	<p>Double clicks the element identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																												
Drag And Drop	<i>locator, target</i>	<p>Drags the element identified by <code>locator</code> into the <code>target</code> element.</p> <p>The <code>locator</code> argument is the locator of the dragged element and the <code>target</code> is the locator of the target. See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>Example:</p> <table><tr><td><i>Drag And Drop</i></td><td><code>css:div#element</code></td><td><code>css:div.target</code></td></tr></table>	<i>Drag And Drop</i>	<code>css:div#element</code>	<code>css:div.target</code>																									
<i>Drag And Drop</i>	<code>css:div#element</code>	<code>css:div.target</code>																												
Drag And Drop By Offset	<i>locator, xoffset, yoffset</i>	<p>Drags the element identified with <code>locator</code> by <code>xoffset/yoffset</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>The element will be moved by <code>xoffset</code> and <code>yoffset</code>, each of which is a negative or positive number specifying the offset.</p> <p>Example:</p> <table><tr><td><i>Drag And Drop By Offset</i></td><td><code>myElem</code></td><td><code>50</code></td><td><code>-35</code></td><td><code># Move myElem 50px right and 35px down</code></td></tr></table>	<i>Drag And Drop By Offset</i>	<code>myElem</code>	<code>50</code>	<code>-35</code>	<code># Move myElem 50px right and 35px down</code>																							
<i>Drag And Drop By Offset</i>	<code>myElem</code>	<code>50</code>	<code>-35</code>	<code># Move myElem 50px right and 35px down</code>																										
Element Attribute Value Should Be	<i>locator, attribute, expected, message=None</i>	<p>Verifies element identified by <code>locator</code> contains expected attribute value.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>Example: <i>Element Attribute Value Should Be</i> <code>css:img</code> <code>href</code> <code>value</code></p> <p>New in SeleniumLibrary 3.2.</p>																												
Element Should Be Disabled	<i>locator</i>	<p>Verifies that element identified by <code>locator</code> is disabled.</p> <p>This keyword considers also elements that are read-only to be disabled.</p>																												

		See the Locating elements section for details about the locator syntax.																					
Element Should Be Enabled	<code>locator</code>	<p>Verifies that element identified by <code>locator</code> is enabled.</p> <p>This keyword considers also elements that are read-only to be disabled.</p> <p>See the Locating elements section for details about the locator syntax.</p>																					
Element Should Be Focused	<code>locator</code>	<p>Verifies that element identified by <code>locator</code> is focused.</p> <p>See the Locating elements section for details about the locator syntax.</p> <p>New in SeleniumLibrary 3.0.</p>																					
Element Should Be Visible	<code>locator, message=None</code>	<p>Verifies that the element identified by <code>locator</code> is visible.</p> <p>Herein, visible means that the element is logically visible, not optically visible in the current browser viewport. For example, an element that carries <code>display:none</code> is not logically visible, so using this keyword on that element would fail.</p> <p>See the Locating elements section for details about the locator syntax.</p> <p>The <code>message</code> argument can be used to override the default error message.</p>																					
Element Should Contain	<code>locator, expected, message=None, ignore_case=False</code>	<p>Verifies that element <code>locator</code> contains text <code>expected</code>.</p> <p>See the Locating elements section for details about the locator syntax.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p>The <code>ignore_case</code> argument can be set to True to compare case insensitive, default is False. New in SeleniumLibrary 3.1.</p> <p><code>ignore_case</code> argument is new in SeleniumLibrary 3.1.</p> <p>Use Element Text Should Be if you want to match the exact text, not a substring.</p>																					
Element Should Not Be Visible	<code>locator, message=None</code>	<p>Verifies that the element identified by <code>locator</code> is NOT visible.</p> <p>Passes if the element does not exists. See Element Should Be Visible for more information about visibility and supported arguments.</p>																					
Element Should Not Contain	<code>locator, expected, message=None, ignore_case=False</code>	<p>Verifies that element <code>locator</code> does not contain text <code>expected</code>.</p> <p>See the Locating elements section for details about the locator syntax.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p>The <code>ignore_case</code> argument can be set to True to compare case insensitive, default is False.</p> <p><code>ignore_case</code> argument new in SeleniumLibrary 3.1.</p>																					
Element Text Should Be	<code>locator, expected, message=None, ignore_case=False</code>	<p>Verifies that element <code>locator</code> contains exact the text <code>expected</code>.</p> <p>See the Locating elements section for details about the locator syntax.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p>The <code>ignore_case</code> argument can be set to True to compare case insensitive, default is False.</p> <p><code>ignore_case</code> argument is new in SeleniumLibrary 3.1.</p> <p>Use Element Should Contain if a substring match is desired.</p>																					
Element Text Should Not Be	<code>locator, not_expected, message=None, ignore_case=False</code>	<p>Verifies that element <code>locator</code> does not contain exact the text <code>not_expected</code>.</p> <p>See the Locating elements section for details about the locator syntax.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p>The <code>ignore_case</code> argument can be set to True to compare case insensitive, default is False.</p> <p>New in SeleniumLibrary 3.1.1</p>																					
Execute Async Javascript	<code>*code</code>	<p>Executes asynchronous JavaScript code with possible arguments.</p> <p>Similar to Execute Javascript except that scripts executed with this keyword must explicitly signal they are finished by invoking the provided callback. This callback is always injected into the executed function as the last argument.</p> <p>Scripts must complete within the script timeout or this keyword will fail. See the Timeout section for more information.</p> <p>Starting from SeleniumLibrary 3.2 it is possible to provide JavaScript arguments as part of <code>code</code> argument. See Execute Javascript for more details.</p> <p>Examples:</p> <table border="1"> <tr> <td>Execute Async JavaScript</td> <td><code>var callback = arguments[arguments.length - 1]; window.setTimeout(callback, 2000);</code></td> <td></td> </tr> <tr> <td>Execute Async JavaScript</td> <td><code>\${CURDIR}/async_js_to_execute.js</code></td> <td></td> </tr> <tr> <td><code>\$(result) =</code></td> <td>Execute Async JavaScript</td> <td></td> </tr> <tr> <td><code>...</code></td> <td><code>var callback = arguments[arguments.length - 1];</code></td> <td></td> </tr> <tr> <td><code>...</code></td> <td><code>function answer(){callback("text");};</code></td> <td></td> </tr> <tr> <td><code>...</code></td> <td><code>window.setTimeout(answer, 2000);</code></td> <td></td> </tr> <tr> <td>Should Be Equal</td> <td><code>\$(result)</code></td> <td>text</td> </tr> </table>	Execute Async JavaScript	<code>var callback = arguments[arguments.length - 1]; window.setTimeout(callback, 2000);</code>		Execute Async JavaScript	<code>\${CURDIR}/async_js_to_execute.js</code>		<code>\$(result) =</code>	Execute Async JavaScript		<code>...</code>	<code>var callback = arguments[arguments.length - 1];</code>		<code>...</code>	<code>function answer(){callback("text");};</code>		<code>...</code>	<code>window.setTimeout(answer, 2000);</code>		Should Be Equal	<code>\$(result)</code>	text
Execute Async JavaScript	<code>var callback = arguments[arguments.length - 1]; window.setTimeout(callback, 2000);</code>																						
Execute Async JavaScript	<code>\${CURDIR}/async_js_to_execute.js</code>																						
<code>\$(result) =</code>	Execute Async JavaScript																						
<code>...</code>	<code>var callback = arguments[arguments.length - 1];</code>																						
<code>...</code>	<code>function answer(){callback("text");};</code>																						
<code>...</code>	<code>window.setTimeout(answer, 2000);</code>																						
Should Be Equal	<code>\$(result)</code>	text																					
Execute Javascript	<code>*code</code>	<p>Executes the given JavaScript code with possible arguments.</p> <p><code>code</code> may be divided into multiple cells in the test data and <code>code</code> may contain multiple lines of code and arguments. In that case, the JavaScript code parts are concatenated together without adding spaces and optional arguments are separated from <code>code</code>.</p> <p>If <code>code</code> is a path to an existing file, the JavaScript to execute will be read from that file. Forward slashes work as a path separator on all operating systems.</p> <p>The JavaScript executes in the context of the currently selected frame or window as the body of an anonymous function. Use <code>window</code> to refer to the window of your application and <code>document</code> to refer to the document object of the current frame or window, e.g. <code>document.getElementById('example')</code>.</p> <p>This keyword returns whatever the executed JavaScript code returns. Return values are converted to the appropriate Python types.</p>																					

		<p>Starting from SeleniumLibrary 3.2 it is possible to provide JavaScript <code>arguments</code> as part of <code>code</code> argument. The JavaScript code and arguments must be separated with <code>JAVASCRIPT</code> and <code>ARGUMENTS</code> markers and must be used exactly with this format. If the Javascript code is first, then the <code>JAVASCRIPT</code> marker is optional. The order of <code>JAVASCRIPT</code> and <code>ARGUMENTS</code> markers can be swapped, but if <code>ARGUMENTS</code> is the first marker, then <code>JAVASCRIPT</code> marker is mandatory. It is only allowed to use <code>JAVASCRIPT</code> and <code>ARGUMENTS</code> markers only one time in the <code>code</code> argument.</p> <p>Examples:</p> <table><tr><td><code>Execute JavaScript</code></td><td><code>window.myFunc('arg1', 'arg2')</code></td><td></td><td></td><td></td></tr><tr><td><code>Execute JavaScript</code></td><td><code>\${CURDIR}/js_to_execute.js</code></td><td></td><td></td><td></td></tr><tr><td><code>Execute JavaScript</code></td><td><code>alert(arguments[0]);</code></td><td><code>ARGUMENTS</code></td><td><code>123</code></td><td></td></tr><tr><td><code>Execute JavaScript</code></td><td><code>ARGUMENTS</code></td><td><code>123</code></td><td><code>JAVASCRIPT</code></td><td><code>alert(arguments[0]);</code></td></tr></table>	<code>Execute JavaScript</code>	<code>window.myFunc('arg1', 'arg2')</code>				<code>Execute JavaScript</code>	<code>\${CURDIR}/js_to_execute.js</code>				<code>Execute JavaScript</code>	<code>alert(arguments[0]);</code>	<code>ARGUMENTS</code>	<code>123</code>		<code>Execute JavaScript</code>	<code>ARGUMENTS</code>	<code>123</code>	<code>JAVASCRIPT</code>	<code>alert(arguments[0]);</code>																
<code>Execute JavaScript</code>	<code>window.myFunc('arg1', 'arg2')</code>																																					
<code>Execute JavaScript</code>	<code>\${CURDIR}/js_to_execute.js</code>																																					
<code>Execute JavaScript</code>	<code>alert(arguments[0]);</code>	<code>ARGUMENTS</code>	<code>123</code>																																			
<code>Execute JavaScript</code>	<code>ARGUMENTS</code>	<code>123</code>	<code>JAVASCRIPT</code>	<code>alert(arguments[0]);</code>																																		
Frame Should Contain	<code>locator</code> , <code>text</code> , <code>loglevel=TRACE</code>	<p>Verifies that frame identified by <code>locator</code> contains <code>text</code>.</p> <p>See the <code>Locating elements</code> section for details about the locator syntax.</p> <p>See <code>Page Should Contain</code> for an explanation about the <code>loglevel</code> argument.</p>																																				
Get All Links		<p>Returns a list containing ids of all links found in current page.</p> <p>If a link has no id, an empty string will be in the list instead.</p>																																				
Get Browser Aliases		<p>Returns aliases of all active browser that has an alias as NormalizedDict. The dictionary contains the aliases as keys and the index as value. This can be accessed as dictionary <code>\${aliases.key}</code> or as list <code>@{aliases}[0]</code>.</p> <p>Example:</p> <table><tr><td><code>Open Browser</code></td><td><code>https://example.com</code></td><td><code>alias=BrowserA</code></td><td></td></tr><tr><td><code>Open Browser</code></td><td><code>https://example.com</code></td><td><code>alias=BrowserB</code></td><td></td></tr><tr><td><code>&{aliases}</code></td><td><code>Get Browser Aliases</code></td><td></td><td><code># &{aliases} = { BrowserA=1 BrowserB=2 }</code></td></tr><tr><td><code>Log</code></td><td><code>\${aliases.BrowserA}</code></td><td></td><td><code># logs 1</code></td></tr><tr><td><code>FOR</code></td><td><code>\${alias}</code></td><td><code>IN</code></td><td><code>@{aliases}</code></td></tr><tr><td></td><td><code>Log</code></td><td><code>\${alias}</code></td><td><code># logs BrowserA and BrowserB</code></td></tr><tr><td><code>END</code></td><td></td><td></td><td></td></tr></table> <p>See <code>Switch Browser</code> for more information and examples.</p> <p>New in SeleniumLibrary 4.0</p>				<code>Open Browser</code>	<code>https://example.com</code>	<code>alias=BrowserA</code>		<code>Open Browser</code>	<code>https://example.com</code>	<code>alias=BrowserB</code>		<code>&{aliases}</code>	<code>Get Browser Aliases</code>		<code># &{aliases} = { BrowserA=1 BrowserB=2 }</code>	<code>Log</code>	<code>\${aliases.BrowserA}</code>		<code># logs 1</code>	<code>FOR</code>	<code>\${alias}</code>	<code>IN</code>	<code>@{aliases}</code>		<code>Log</code>	<code>\${alias}</code>	<code># logs BrowserA and BrowserB</code>	<code>END</code>								
<code>Open Browser</code>	<code>https://example.com</code>	<code>alias=BrowserA</code>																																				
<code>Open Browser</code>	<code>https://example.com</code>	<code>alias=BrowserB</code>																																				
<code>&{aliases}</code>	<code>Get Browser Aliases</code>		<code># &{aliases} = { BrowserA=1 BrowserB=2 }</code>																																			
<code>Log</code>	<code>\${aliases.BrowserA}</code>		<code># logs 1</code>																																			
<code>FOR</code>	<code>\${alias}</code>	<code>IN</code>	<code>@{aliases}</code>																																			
	<code>Log</code>	<code>\${alias}</code>	<code># logs BrowserA and BrowserB</code>																																			
<code>END</code>																																						
Get Browser Ids		<p>Returns index of all active browser as list.</p> <p>Example:</p> <table><tr><td><code>@{browser_ids}=</code></td><td><code>Get Browser Ids</code></td><td></td><td></td></tr><tr><td><code>FOR</code></td><td><code>\${id}</code></td><td><code>IN</code></td><td><code>@{browser_ids}</code></td></tr><tr><td></td><td><code>@{window_titles}=</code></td><td><code>Get Window Titles</code></td><td><code>browser=\${id}</code></td></tr><tr><td></td><td><code>Log</code></td><td colspan="2"><code>Browser \${id} has these windows: \${window_titles}</code></td></tr><tr><td><code>END</code></td><td></td><td></td><td></td></tr></table> <p>See <code>Switch Browser</code> for more information and examples.</p> <p>New in SeleniumLibrary 4.0</p>				<code>@{browser_ids}=</code>	<code>Get Browser Ids</code>			<code>FOR</code>	<code>\${id}</code>	<code>IN</code>	<code>@{browser_ids}</code>		<code>@{window_titles}=</code>	<code>Get Window Titles</code>	<code>browser=\${id}</code>		<code>Log</code>	<code>Browser \${id} has these windows: \${window_titles}</code>		<code>END</code>																
<code>@{browser_ids}=</code>	<code>Get Browser Ids</code>																																					
<code>FOR</code>	<code>\${id}</code>	<code>IN</code>	<code>@{browser_ids}</code>																																			
	<code>@{window_titles}=</code>	<code>Get Window Titles</code>	<code>browser=\${id}</code>																																			
	<code>Log</code>	<code>Browser \${id} has these windows: \${window_titles}</code>																																				
<code>END</code>																																						
Get Cookie	<code>name</code>	<p>Returns information of cookie with <code>name</code> as an object.</p> <p>If no cookie is found with <code>name</code>, keyword fails. The cookie object contains details about the cookie. Attributes available in the object are documented in the table below.</p> <table><tr><th>Attribute</th><th>Explanation</th></tr><tr><td><code>name</code></td><td>The name of a cookie.</td></tr><tr><td><code>value</code></td><td>Value of the cookie.</td></tr><tr><td><code>path</code></td><td>Indicates a URL path, for example <code>/</code>.</td></tr><tr><td><code>domain</code></td><td>The domain, the cookie is visible to.</td></tr><tr><td><code>secure</code></td><td>When true, the cookie is only used with HTTPS connections.</td></tr><tr><td><code>httpOnly</code></td><td>When true, the cookie is not accessible via JavaScript.</td></tr><tr><td><code>expiry</code></td><td>Python datetime object indicating when the cookie expires.</td></tr><tr><td><code>extra</code></td><td>Possible attributes outside of the WebDriver specification</td></tr></table> <p>See the <code>WebDriver specification</code> for details about the cookie information. Notice that <code>expiry</code> is specified as a <code>datetime object</code>, not as seconds since Unix Epoch like WebDriver natively does.</p> <p>In some cases, example when running a browser in the cloud, it is possible that the cookie contains other attributes than is defined in the <code>WebDriver specification</code>. These other attributes are available in an <code>extra</code> attribute in the cookie object and it contains a dictionary of the other attributes. The <code>extra</code> attribute is new in SeleniumLibrary 4.0.</p> <p>Example:</p> <table><tr><td><code>Add Cookie</code></td><td><code>foo</code></td><td><code>bar</code></td></tr><tr><td><code>\${cookie} =</code></td><td><code>Get Cookie</code></td><td><code>foo</code></td></tr><tr><td><code>Should Be Equal</code></td><td><code>\${cookie.name}</code></td><td><code>foo</code></td></tr><tr><td><code>Should Be Equal</code></td><td><code>\${cookie.value}</code></td><td><code>bar</code></td></tr><tr><td><code>Should Be True</code></td><td><code>\${cookie.expiry.year} > 2017</code></td><td></td></tr></table> <p>New in SeleniumLibrary 3.0.</p>				Attribute	Explanation	<code>name</code>	The name of a cookie.	<code>value</code>	Value of the cookie.	<code>path</code>	Indicates a URL path, for example <code>/</code> .	<code>domain</code>	The domain, the cookie is visible to.	<code>secure</code>	When true, the cookie is only used with HTTPS connections.	<code>httpOnly</code>	When true, the cookie is not accessible via JavaScript.	<code>expiry</code>	Python datetime object indicating when the cookie expires.	<code>extra</code>	Possible attributes outside of the WebDriver specification	<code>Add Cookie</code>	<code>foo</code>	<code>bar</code>	<code>\${cookie} =</code>	<code>Get Cookie</code>	<code>foo</code>	<code>Should Be Equal</code>	<code>\${cookie.name}</code>	<code>foo</code>	<code>Should Be Equal</code>	<code>\${cookie.value}</code>	<code>bar</code>	<code>Should Be True</code>	<code>\${cookie.expiry.year} > 2017</code>	
Attribute	Explanation																																					
<code>name</code>	The name of a cookie.																																					
<code>value</code>	Value of the cookie.																																					
<code>path</code>	Indicates a URL path, for example <code>/</code> .																																					
<code>domain</code>	The domain, the cookie is visible to.																																					
<code>secure</code>	When true, the cookie is only used with HTTPS connections.																																					
<code>httpOnly</code>	When true, the cookie is not accessible via JavaScript.																																					
<code>expiry</code>	Python datetime object indicating when the cookie expires.																																					
<code>extra</code>	Possible attributes outside of the WebDriver specification																																					
<code>Add Cookie</code>	<code>foo</code>	<code>bar</code>																																				
<code>\${cookie} =</code>	<code>Get Cookie</code>	<code>foo</code>																																				
<code>Should Be Equal</code>	<code>\${cookie.name}</code>	<code>foo</code>																																				
<code>Should Be Equal</code>	<code>\${cookie.value}</code>	<code>bar</code>																																				
<code>Should Be True</code>	<code>\${cookie.expiry.year} > 2017</code>																																					
Get Cookies	<code>as_dict=False</code>	<p>Returns all cookies of the current page.</p> <p>If <code>as_dict</code> argument evaluates as false, see <code>Boolean arguments</code> for more details, then cookie information is returned as a single string in format <code>name1=value1; name2=value2; name3=value3</code>. When <code>as_dict</code> argument evaluates as true, cookie information is returned as Robot Framework dictionary format. The string format can be used, for example, for logging purposes or in headers when sending HTTP requests. The dictionary format is helpful when the result can be passed to requests library's Create Session keyword's optional cookies parameter.</p> <p>The <code>`as_dict`</code> argument is new in SeleniumLibrary 3.3</p>																																				
Get Element Attribute	<code>locator</code> , <code>attribute</code>	<p>Returns the value of <code>attribute</code> from the element <code>locator</code>.</p> <p>See the <code>Locating elements</code> section for details about the locator syntax.</p> <p>Example:</p>																																				

9/20

Get Table Cell	locator, row, column, loglevel=TRACE	<p>Returns contents of a table cell.</p> <p>The table is located using the <code>locator</code> argument and its cell found using <code>row</code> and <code>column</code>. See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>Both row and column indexes start from 1, and header and footer rows are included in the count. It is possible to refer to rows and columns from the end by using negative indexes so that -1 is the last row/column, -2 is the second last, and so on.</p> <p>All <code><th></code> and <code><td></code> elements anywhere in the table are considered to be cells.</p> <p>See <i>Page Should Contain</i> for an explanation about the <code>loglevel</code> argument.</p>																								
Get Text	locator	<p>Returns the text value of the element identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																								
Get Title		Returns the title of the current page.																								
Get Value	locator	<p>Returns the value attribute of the element identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																								
Get Vertical Position	locator	<p>Returns the vertical position of the element identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>The position is returned in pixels off the top of the page, as an integer.</p> <p>See also <i>Get Horizontal Position</i>.</p>																								
Get WebElement	locator	<p>Returns the first WebElement matching the given <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																								
Get WebElements	locator	<p>Returns a list of WebElement objects matching the <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>Starting from SeleniumLibrary 3.0, the keyword returns an empty list if there are no matching elements. In previous releases, the keyword failed in this case.</p>																								
Get Window Handles	browser=CURRENT	<p>Returns all child window handles of the selected browser as a list.</p> <p>Can be used as a list of windows to exclude with <i>Select Window</i>.</p> <p>How to select the <code>browser</code> scope of this keyword, see <i>Get Locations</i>.</p> <p>Prior to SeleniumLibrary 3.0, this keyword was named <i>List Windows</i>.</p>																								
Get Window Identifiers	browser=CURRENT	<p>Returns and logs id attributes of all windows of the selected browser.</p> <p>How to select the <code>browser</code> scope of this keyword, see <i>Get Locations</i>.</p>																								
Get Window Names	browser=CURRENT	<p>Returns and logs names of all windows of the selected browser.</p> <p>How to select the <code>browser</code> scope of this keyword, see <i>Get Locations</i>.</p>																								
Get Window Position		<p>Returns current window position.</p> <p>The position is relative to the top left corner of the screen. Returned values are integers. See also <i>Set Window Position</i>.</p> <p>Example:</p> <table><tr><td><code>\${x}</code></td><td><code>\${y}</code></td><td>=</td><td><i>Get Window Position</i></td></tr></table>	<code>\${x}</code>	<code>\${y}</code>	=	<i>Get Window Position</i>																				
<code>\${x}</code>	<code>\${y}</code>	=	<i>Get Window Position</i>																							
Get Window Size	inner=False	<p>Returns current window width and height as integers.</p> <p>See also <i>Set Window Size</i>.</p> <p>If <code>inner</code> parameter is set to True, keyword returns HTML DOM window.innerWidth and window.innerHeight properties. See <i>Boolean arguments</i> for more details on how to set boolean arguments. The <code>inner</code> is new in SeleniumLibrary 4.0.</p> <p>Example:</p> <table><tr><td><code>\${width}</code></td><td><code>\${height}</code></td><td>=</td><td><i>Get Window Size</i></td><td></td></tr><tr><td><code>\${width}</code></td><td><code>\${height}</code></td><td>=</td><td><i>Get Window Size</i></td><td>True</td></tr></table>	<code>\${width}</code>	<code>\${height}</code>	=	<i>Get Window Size</i>		<code>\${width}</code>	<code>\${height}</code>	=	<i>Get Window Size</i>	True														
<code>\${width}</code>	<code>\${height}</code>	=	<i>Get Window Size</i>																							
<code>\${width}</code>	<code>\${height}</code>	=	<i>Get Window Size</i>	True																						
Get Window Titles	browser=CURRENT	<p>Returns and logs titles of all windows of the selected browser.</p> <p>How to select the <code>browser</code> scope of this keyword, see <i>Get Locations</i>.</p>																								
Go Back		Simulates the user clicking the back button on their browser.																								
Go To	url	Navigates the current browser window to the provided <code>url</code> .																								
Handle Alert	action=ACCEPT, timeout=None	<p>Handles the current alert and returns its message.</p> <p>By default, the alert is accepted, but this can be controlled with the <code>action</code> argument that supports the following case-insensitive values:</p> <ul style="list-style-type: none"><code>ACCEPT</code> : Accept the alert i.e. press <code>Ok</code>. Default.<code>DISMISS</code> : Dismiss the alert i.e. press <code>Cancel</code>.<code>LEAVE</code> : Leave the alert open. <p>The <code>timeout</code> argument specifies how long to wait for the alert to appear. If it is not given, the global default <i>timeout</i> is used instead.</p> <p>Examples:</p> <table><tr><td>Handle Alert</td><td></td><td></td><td># Accept alert.</td></tr><tr><td>Handle Alert</td><td>action=DISMISS</td><td></td><td># Dismiss alert.</td></tr><tr><td>Handle Alert</td><td>timeout=10 s</td><td></td><td># Use custom timeout and accept alert.</td></tr><tr><td>Handle Alert</td><td>DISMISS</td><td>1 min</td><td># Use custom timeout and dismiss alert.</td></tr><tr><td><code>\$(message) =</code></td><td>Handle Alert</td><td></td><td># Accept alert and get its message.</td></tr><tr><td><code>\$(message) =</code></td><td>Handle Alert</td><td>LEAVE</td><td># Leave alert open and get its message.</td></tr></table> <p>New in SeleniumLibrary 3.0.</p>	Handle Alert			# Accept alert.	Handle Alert	action=DISMISS		# Dismiss alert.	Handle Alert	timeout=10 s		# Use custom timeout and accept alert.	Handle Alert	DISMISS	1 min	# Use custom timeout and dismiss alert.	<code>\$(message) =</code>	Handle Alert		# Accept alert and get its message.	<code>\$(message) =</code>	Handle Alert	LEAVE	# Leave alert open and get its message.
Handle Alert			# Accept alert.																							
Handle Alert	action=DISMISS		# Dismiss alert.																							
Handle Alert	timeout=10 s		# Use custom timeout and accept alert.																							
Handle Alert	DISMISS	1 min	# Use custom timeout and dismiss alert.																							
<code>\$(message) =</code>	Handle Alert		# Accept alert and get its message.																							
<code>\$(message) =</code>	Handle Alert	LEAVE	# Leave alert open and get its message.																							

Input Password	locator, password, clear=True	<p>Types the given password into the text field identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax. See <i>Input Text</i> for <code>clear</code> argument details.</p> <p>Difference compared to <i>Input Text</i> is that this keyword does not log the given password on the INFO level. Notice that if you use the keyword like</p> <pre>Input Password password_field password</pre> <p>the password is shown as a normal keyword argument. A way to avoid that is using variables like</p> <pre>Input Password password_field \${PASSWORD}</pre> <p>Please notice that Robot Framework logs all arguments using the TRACE level and tests must not be executed using level below DEBUG if the password should not be logged in any format.</p> <p>The <i>clear</i> argument is new in SeleniumLibrary 4.0. Hiding password logging from Selenium logs is new in SeleniumLibrary 4.2.</p>								
Input Text	locator, text, clear=True	<p>Types the given <code>text</code> into the text field identified by <code>locator</code>.</p> <p>When <code>clear</code> is true, the input element is cleared before the text is typed into the element. When false, the previous text is not cleared from the element. Use <i>Input Password</i> if you do not want the given <code>text</code> to be logged.</p> <p>If <i>Selenium Grid</i> is used and the <code>text</code> argument points to a file in the file system, then this keyword prevents the Selenium to transfer the file to the Selenium Grid hub. Instead, this keyword will send the <code>text</code> string as is to the element. If a file should be transferred to the hub and upload should be performed, please use <i>Choose File</i> keyword.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax. See the <i>Boolean arguments</i> section how Boolean values are handled.</p> <p>Disabling the file upload the Selenium Grid node and the <i>clear</i> argument are new in SeleniumLibrary 4.0</p>								
Input Text Into Alert	text, action=ACCEPT, timeout=None	<p>Types the given <code>text</code> into an input field in an alert.</p> <p>The alert is accepted by default, but that behavior can be controlled by using the <code>action</code> argument same way as with <i>Handle Alert</i>.</p> <p><code>timeout</code> specifies how long to wait for the alert to appear. If it is not given, the global default <i>timeout</i> is used instead.</p> <p>New in SeleniumLibrary 3.0.</p>								
List Selection Should Be	locator, *expected	<p>Verifies selection list <code>locator</code> has <code>expected</code> options selected.</p> <p>It is possible to give expected options both as visible labels and as values. Starting from SeleniumLibrary 3.0, mixing labels and values is not possible. Order of the selected options is not validated.</p> <p>If no expected options are given, validates that the list has no selections. A more explicit alternative is using <i>List Should Have No Selections</i>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>Examples:</p> <table><tr><td><i>List Selection Should Be</i></td><td>gender</td><td>Female</td><td></td></tr><tr><td><i>List Selection Should Be</i></td><td>interests</td><td>Test Automation</td><td>Python</td></tr></table>	<i>List Selection Should Be</i>	gender	Female		<i>List Selection Should Be</i>	interests	Test Automation	Python
<i>List Selection Should Be</i>	gender	Female								
<i>List Selection Should Be</i>	interests	Test Automation	Python							
List Should Have No Selections	locator	<p>Verifies selection list <code>locator</code> has no options selected.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>								
Location Should Be	url, message=None	<p>Verifies that the current URL is exactly <code>url</code>.</p> <p>The <code>url</code> argument contains the exact url that should exist in browser.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p><code>message</code> argument is new in SeleniumLibrary 3.2.0.</p>								
Location Should Contain	expected, message=None	<p>Verifies that the current URL contains <code>expected</code>.</p> <p>The <code>expected</code> argument contains the expected value in url.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p><code>message</code> argument is new in SeleniumLibrary 3.2.0.</p>								
Locator Should Match X Times	locator, x, message=None, loglevel=TRACE	DEPRECATED in SeleniumLibrary 4.0. , use <i>Page Should Contain Element</i> with <code>limit</code> argument instead.								
Log Location		Logs and returns the current browser window URL.								
Log Source	loglevel=INFO	<p>Logs and returns the HTML source of the current page or frame.</p> <p>The <code>loglevel</code> argument defines the used log level. Valid log levels are <code>WARN</code>, <code>INFO</code> (default), <code>DEBUG</code>, <code>TRACE</code> and <code>NONE</code> (no logging).</p>								
Log Title		Logs and returns the title of the current page.								
Maximize Browser Window		Maximizes current browser window.								
Mouse Down	locator	<p>Simulates pressing the left mouse button on the element <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>The element is pressed without releasing the mouse button.</p> <p>See also the more specific keywords <i>Mouse Down On Image</i> and <i>Mouse Down On Link</i>.</p>								
Mouse Down On Image	locator	<p>Simulates a mouse down event on an image identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax. When using the default locator strategy, images are searched using <code>id</code>, <code>name</code>, <code>src</code> and <code>alt</code>.</p>								
Mouse Down On Link	locator	<p>Simulates a mouse down event on a link identified by <code>locator</code>.</p>								

		See the Locating elements section for details about the locator syntax. When using the default locator strategy, links are searched using <code>id</code> , <code>name</code> , <code>href</code> and the link text.																												
Mouse Out	<code>locator</code>	<p>Simulates moving the mouse away from the element <code>locator</code>.</p> <p>See the Locating elements section for details about the locator syntax.</p>																												
Mouse Over	<code>locator</code>	<p>Simulates hovering the mouse over the element <code>locator</code>.</p> <p>See the Locating elements section for details about the locator syntax.</p>																												
Mouse Up	<code>locator</code>	<p>Simulates releasing the left mouse button on the element <code>locator</code>.</p> <p>See the Locating elements section for details about the locator syntax.</p>																												
Open Browser	<code>url=None, browser=firefox, alias=None, remote_url=False, desired_capabilities=None, ff_profile_dir=None, options=None, service_log_path=None, executable_path=None</code>	<p>Opens a new browser instance to the optional <code>url</code>.</p> <p>The <code>browser</code> argument specifies which browser to use. The supported browsers are listed in the table below. The browser names are case-insensitive and some browsers have multiple supported names.</p> <table><tr><th>Browser</th><th>Name(s)</th></tr><tr><td>Firefox</td><td>firefox, ff</td></tr><tr><td>Google Chrome</td><td>googlechrome, chrome, gc</td></tr><tr><td>Headless Firefox</td><td>headlessfirefox</td></tr><tr><td>Headless Chrome</td><td>headlesschrome</td></tr><tr><td>Internet Explorer</td><td>internetexplorer, ie</td></tr><tr><td>Edge</td><td>edge</td></tr><tr><td>Safari</td><td>safari</td></tr><tr><td>Opera</td><td>opera</td></tr><tr><td>Android</td><td>android</td></tr><tr><td>Iphone</td><td>iphone</td></tr><tr><td>PhantomJS</td><td>phantomjs</td></tr><tr><td>HTMLUnit</td><td>htmlunit</td></tr><tr><td>HTMLUnit with Javascript</td><td>htmlunitwithjs</td></tr></table> <p>To be able to actually use one of these browsers, you need to have a matching Selenium browser driver available. See the project documentation for more details. Headless Firefox and Headless Chrome are new additions in SeleniumLibrary 3.1.0 and require Selenium 3.8.0 or newer.</p> <p>After opening the browser, it is possible to use optional <code>url</code> to navigate the browser to the desired address.</p> <p>Optional <code>alias</code> is an alias given for this browser instance and it can be used for switching between browsers. When same <code>alias</code> is given with two Open Browser keywords, the first keyword will open a new browser, but the second one will switch to the already opened browser and will not open a new browser. The <code>alias</code> definition overrules <code>browser</code> definition. When same <code>alias</code> is used but a different <code>browser</code> is defined, then switch to a browser with same alias is done and new browser is not opened. An alternative approach for switching is using an index returned by this keyword. These indices start from 1, are incremented when new browsers are opened, and reset back to 1 when Close All Browsers is called. See Switch Browser for more information and examples.</p> <p>Optional <code>remote_url</code> is the URL for a Selenium Grid.</p> <p>Optional <code>desired_capabilities</code> can be used to configure, for example, logging preferences for a browser or a browser and operating system when using Sauce Labs. Desired capabilities can be given either as a Python dictionary or as a string in the format <code>key1:value1, key2:value2</code>. Selenium documentation lists possible capabilities that can be enabled.</p> <p>Optional <code>ff_profile_dir</code> is the path to the Firefox profile directory if you wish to overwrite the default profile Selenium uses. Notice that prior to SeleniumLibrary 3.0, the library contained its own profile that was used by default. The <code>ff_profile_dir</code> can also be an instance of the selenium.webdriver.FirefoxProfile. As a third option, it is possible to use FirefoxProfile methods and attributes to define the profile using methods and attributes in the same way as with <code>options</code> argument. Example: It is possible to use FirefoxProfile.set_preference to define different profile settings. See <code>options</code> argument documentation in below how to handle backslash escaping.</p> <p>Optional <code>options</code> argument allows defining browser specific Selenium options. Example for Chrome, the <code>options</code> argument allows defining the following methods and attributes and for Firefox these methods and attributes are available. Please note that not all browsers, supported by the SeleniumLibrary, have Selenium options available. Therefore please consult the Selenium documentation which browsers do support the Selenium options. If <code>browser</code> argument is <i>android</i> then Chrome options is used. Selenium options are also supported, when <code>remote_url</code> argument is used.</p> <p>The SeleniumLibrary <code>options</code> argument accepts Selenium options in two different formats: as a string and as Python object which is an instance of the Selenium options class.</p> <p>The string format allows defining Selenium options methods or attributes and their arguments in Robot Framework test data. The method and attributes names are case and space sensitive and must match to the Selenium options methods and attributes names. When defining a method, it must be defined in a similar way as in python: method name, opening parenthesis, zero to many arguments and closing parenthesis. If there is a need to define multiple arguments for a single method, arguments must be separated with comma, just like in Python. Example: <code>add_argument("--headless")</code> or <code>add_experimental_option("key", "value")</code>. Attributes are defined in a similar way as in Python: attribute name, equal sign, and attribute value. Example, <code>headless=True</code>. Multiple methods and attributes must be separated by a semicolon. Example: <code>add_argument("--headless");add_argument("--start-maximized")</code>.</p> <p>Arguments allow defining Python data types and arguments are evaluated by using Python ast.literal_eval. Strings must be quoted with single or double quotes, example "value" or 'value'. It is also possible to define other Python builtin data types, example <i>True</i> or <i>None</i>, by not using quotes around the arguments.</p> <p>The string format is space friendly. Usually, spaces do not alter the defining methods or attributes. There are two exceptions. In some Robot Framework test data formats, two or more spaces are considered as cell separator and instead of defining a single argument, two or more arguments may be defined. Spaces in string arguments are not removed and are left as is. Example <code>add_argument (" --headless")</code> is same as <code>add_argument("--headless")</code>. But <code>add_argument(" --headless ")</code> is not same same as <code>add_argument (" --headless")</code>, because spaces inside of quotes are not removed. Please note that if options string contains backslash, example a Windows OS path, the backslash needs escaping both in Robot Framework data and in Python side. This means single backslash must be written using four backslash characters. Example, Windows path: "C:\path\to\profile" must be written as "C:\\\\path\\to\\profile". Another way to write backslash is use Python raw strings and example write: <code>r"C:\\path\\to\\profile"</code>.</p> <p>As last format, <code>options</code> argument also supports receiving the Selenium options as Python class instance. In this case, the instance is used as-is and the SeleniumLibrary will not convert the instance to other formats. For</p>	Browser	Name(s)	Firefox	firefox, ff	Google Chrome	googlechrome, chrome, gc	Headless Firefox	headlessfirefox	Headless Chrome	headlesschrome	Internet Explorer	internetexplorer, ie	Edge	edge	Safari	safari	Opera	opera	Android	android	Iphone	iphone	PhantomJS	phantomjs	HTMLUnit	htmlunit	HTMLUnit with Javascript	htmlunitwithjs
Browser	Name(s)																													
Firefox	firefox, ff																													
Google Chrome	googlechrome, chrome, gc																													
Headless Firefox	headlessfirefox																													
Headless Chrome	headlesschrome																													
Internet Explorer	internetexplorer, ie																													
Edge	edge																													
Safari	safari																													
Opera	opera																													
Android	android																													
Iphone	iphone																													
PhantomJS	phantomjs																													
HTMLUnit	htmlunit																													
HTMLUnit with Javascript	htmlunitwithjs																													

example, if the following code return value is saved to `options` variable in the Robot Framework data:

```
options = webdriver.ChromeOptions()
options.add_argument('--disable-dev-shm-usage')
return options
```

Then the `options` variable can be used as an argument to `options`.

Example the `options` argument can be used to launch Chromium-based applications which utilize the **Chromium Embedded Framework**. To launch Chromium-based application, use `options` to define `binary_location` attribute and use `add_argument` method to define `remote-debugging-port` port for the application. Once the browser is opened, the test can interact with the embedded web-content of the system under test.

Optional `service_log_path` argument defines the name of the file where to write the browser driver logs. If the `service_log_path` argument contain a marker `{index}`, it will be automatically replaced with unique running index preventing files to be overwritten. Indices start's from 1, and how they are represented can be customized using Python's **format string syntax**.

Optional `executable_path` argument defines the path to the driver executable, example to a chromedriver or a geckodriver. If not defined it is assumed the executable is in the **\$PATH**.

Examples:

Open Browser	http://example.com	Chrome	
Open Browser	http://example.com	Firefox	alias=Firefox
Open Browser	http://example.com	Edge	remote_url=http://127.0.0.1:4444/wd/hub
Open Browser	about:blank		
Open Browser	browser=Chrome		

Alias examples:

\${1_index} =	Open Browser	http://example.com	Chrome	alias=Chrome	# Opens new browser because alias is new.
\${2_index} =	Open Browser	http://example.com	Firefox		# Opens new browser because alias is not defined.
\${3_index} =	Open Browser	http://example.com	Chrome	alias=Chrome	# Switches to the browser with Chrome alias.
\${4_index} =	Open Browser	http://example.com	Chrome	alias=\${1_index}	# Switches to the browser with Chrome alias.
Should Be Equal		\${1_index}			
Should Be Equal		\${1_index}			
Should Be Equal		\${2_index}			

Example when using **Chrome options** method:

Open Browser	http://example.com	Chrome	options=add_argument("--disable-popup-blocking"); add_argument("--ignore-certificate-errors")	# Sting format.
options =	Get Options			# Selenium options instance.
Open Browser	http://example.com	Chrome	options=options	
Open Browser	None	Chrome	options=binary_location="/path/to/binary";add_argument("remote-debugging-port=port")	# Start Chromium-based application.
Open Browser	None	Chrome	options=binary_location="C:\\path\\to\\binary"	# Windows OS path escaping.

Example for FirefoxProfile

Open Browser	http://example.com	Firefox	ff_profile_dir=/path/to/profile	# Using profile from disk.
Open Browser	http://example.com	Firefox	ff_profile_dir=\${FirefoxProfile_instance}	# Using instance of FirefoxProfile.
Open Browser	http://example.com	Firefox	ff_profile_dir=set_preference("key", "value");set_preference("other", "setting")	# Defining profile using FirefoxProfile methods.

If the provided configuration options are not enough, it is possible to use **Create Webdriver** to customize browser initialization even more.

Applying `desired_capabilities` argument also for local browser is new in SeleniumLibrary 3.1.

Using `alias` to decide, is the new browser opened is new in SeleniumLibrary 4.0. The `options` and `service_log_path` are new in SeleniumLibrary 4.0. Support for `ff_profile_dir` accepting an instance of the `selenium.webdriver.FirefoxProfile` and support defining FirefoxProfile with methods and attributes are new in SeleniumLibrary 4.0.

Making `url` optional is new in SeleniumLibrary 4.1.

The `executable_path` argument is new in SeleniumLibrary 4.2.

Open Context Menu	locator	Opens the context menu on the element identified by <code>locator</code> .
Page Should Contain	text, loglevel=TRACE	Verifies that current page contains <code>text</code> . If this keyword fails, it automatically logs the page source using the log level specified with the optional <code>loglevel</code> argument. Valid log levels are <code>DEBUG</code> , <code>INFO</code> (default), <code>WARN</code> , and <code>NONE</code> . If the log level is <code>NONE</code> or below the current active log level the source will not be logged.
Page Should Contain Button	locator, message=None, loglevel=TRACE	Verifies button <code>locator</code> is found from current page. See Page Should Contain Element for an explanation about <code>message</code> and <code>loglevel</code> arguments. See the Locating elements section for details about the locator syntax. When using the default locator strategy, buttons are searched using <code>id</code> , <code>name</code> , and <code>value</code> .
Page Should Contain Checkbox	locator, message=None, loglevel=TRACE	Verifies checkbox <code>locator</code> is found from the current page. See Page Should Contain Element for an explanation about <code>message</code> and <code>loglevel</code> arguments.

		See the Locating elements section for details about the locator syntax.																
Page Should Contain Element	locator, message=None, loglevel=TRACE, limit=None	<p>Verifies that element <code>locator</code> is found on the current page.</p> <p>See the Locating elements section for details about the locator syntax.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p>The <code>limit</code> argument can be used to define how many elements the page should contain. When <code>limit</code> is <code>None</code> (default) page can contain one or more elements. When <code>limit</code> is a number, page must contain same number of elements.</p> <p>See Page Should Contain for an explanation about the <code>loglevel</code> argument.</p> <p>Examples assumes that locator matches to two elements.</p> <table><tr><td>Page Should Contain Element</td><td><code>div_name</code></td><td><code>limit=1</code></td><td># Keyword fails.</td></tr><tr><td>Page Should Contain Element</td><td><code>div_name</code></td><td><code>limit=2</code></td><td># Keyword passes.</td></tr><tr><td>Page Should Contain Element</td><td><code>div_name</code></td><td><code>limit=None</code></td><td># None is considered one or more.</td></tr><tr><td>Page Should Contain Element</td><td><code>div_name</code></td><td></td><td># Same as above.</td></tr></table> <p>The <code>limit</code> argument is new in SeleniumLibrary 3.0.</p>	Page Should Contain Element	<code>div_name</code>	<code>limit=1</code>	# Keyword fails. Page Should Not Contain Radio Button	locator, message=None, loglevel=TRACE	<p>Verifies radio button <code>locator</code> is not found from current page.</p> <p>See Page Should Contain Element for an explanation about <code>message</code> and <code>loglevel</code> arguments.</p> <p>See the Locating elements section for details about the locator syntax. When using the default locator strategy, radio buttons are searched using <code>id</code>, <code>name</code> and <code>value</code>.</p>																
Page Should Not Contain Textfield	locator, message=None, loglevel=TRACE	<p>Verifies text field <code>locator</code> is not found from current page.</p> <p>See Page Should Contain Element for an explanation about <code>message</code> and <code>loglevel</code> arguments.</p> <p>See the Locating elements section for details about the locator syntax.</p>																

Press Key	locator, key	DEPRECATED in SeleniumLibrary 4.0. use <i>Press Keys</i> instead.																																													
Press Keys	locator=None, *keys	<p>Simulates the user pressing key(s) to an element or on the active browser.</p> <p>If <code>locator</code> evaluates as false, see <i>Boolean arguments</i> for more details, then the <code>keys</code> are sent to the currently active browser. Otherwise element is searched and <code>keys</code> are sent to the element identified by the <code>locator</code>. In later case, keyword fails if element is not found. See the <i>Locating elements</i> section for details about the locator syntax.</p> <p><code>keys</code> arguments can contain one or many strings, but it can not be empty. <code>keys</code> can also be a combination of <i>Selenium Keys</i> and strings or a single Selenium Key. If Selenium Key is combined with strings, Selenium key and strings must be separated by the + character, like in <i>CONTROL+c</i>. Selenium Keys are space and case sensitive and Selenium Keys are not parsed inside of the string. Example <i>AALTO</i>, would send string <i>AALTO</i> and <i>ALT</i> not parsed inside of the string. But <i>A+ALT+O</i> would found Selenium ALT key from the <code>keys</code> argument. It also possible to press many Selenium Keys down at the same time, example 'ALT+ARROW_DOWN'.</p> <p>If Selenium Keys are detected in the <code>keys</code> argument, keyword will press the Selenium Key down, send the strings and then release the Selenium Key. If keyword needs to send a Selenium Key as a string, then each character must be separated with + character, example <i>E+N+D</i>.</p> <p><i>CTRL</i> is alias for <i>Selenium CONTROL</i> and <i>ESC</i> is alias for <i>Selenium ESCAPE</i></p> <p>New in SeleniumLibrary 3.3</p> <p>Examples:</p> <table><tr><td><i>Press Keys</i></td><td>text_field</td><td>AAAAA</td><td></td><td># Sends string "AAAAA" to element.</td></tr><tr><td><i>Press Keys</i></td><td>None</td><td>BBBBB</td><td></td><td># Sends string "BBBBB" to currently active browser.</td></tr><tr><td><i>Press Keys</i></td><td>text_field</td><td>E+N+D</td><td></td><td># Sends string "END" to element.</td></tr><tr><td><i>Press Keys</i></td><td>text_field</td><td>XXX</td><td>YY</td><td># Sends strings "XXX" and "YY" to element.</td></tr><tr><td><i>Press Keys</i></td><td>text_field</td><td>XXX+YY</td><td></td><td># Same as above.</td></tr><tr><td><i>Press Keys</i></td><td>text_field</td><td>ALT+ARROW_DOWN</td><td></td><td># Pressing "ALT" key down, then pressing ARROW_DOWN and then releasing both keys.</td></tr><tr><td><i>Press Keys</i></td><td>text_field</td><td>ALT</td><td>ARROW_DOWN</td><td># Pressing "ALT" key and then pressing ARROW_DOWN.</td></tr><tr><td><i>Press Keys</i></td><td>text_field</td><td>CTRL+c</td><td></td><td># Pressing CTRL key down, sends string "c" and then releases CTRL key.</td></tr><tr><td><i>Press Keys</i></td><td>button</td><td>RETURN</td><td></td><td># Pressing "ENTER" key to element.</td></tr></table>	<i>Press Keys</i>	text_field	AAAAA		# Sends string "AAAAA" to element.	<i>Press Keys</i>	None	BBBBB		# Sends string "BBBBB" to currently active browser.	<i>Press Keys</i>	text_field	E+N+D		# Sends string "END" to element.	<i>Press Keys</i>	text_field	XXX	YY	# Sends strings "XXX" and "YY" to element.	<i>Press Keys</i>	text_field	XXX+YY		# Same as above.	<i>Press Keys</i>	text_field	ALT+ARROW_DOWN		# Pressing "ALT" key down, then pressing ARROW_DOWN and then releasing both keys.	<i>Press Keys</i>	text_field	ALT	ARROW_DOWN	# Pressing "ALT" key and then pressing ARROW_DOWN.	<i>Press Keys</i>	text_field	CTRL+c		# Pressing CTRL key down, sends string "c" and then releases CTRL key.	<i>Press Keys</i>	button	RETURN		# Pressing "ENTER" key to element.
<i>Press Keys</i>	text_field	AAAAA		# Sends string "AAAAA" to element.																																											
<i>Press Keys</i>	None	BBBBB		# Sends string "BBBBB" to currently active browser.																																											
<i>Press Keys</i>	text_field	E+N+D		# Sends string "END" to element.																																											
<i>Press Keys</i>	text_field	XXX	YY	# Sends strings "XXX" and "YY" to element.																																											
<i>Press Keys</i>	text_field	XXX+YY		# Same as above.																																											
<i>Press Keys</i>	text_field	ALT+ARROW_DOWN		# Pressing "ALT" key down, then pressing ARROW_DOWN and then releasing both keys.																																											
<i>Press Keys</i>	text_field	ALT	ARROW_DOWN	# Pressing "ALT" key and then pressing ARROW_DOWN.																																											
<i>Press Keys</i>	text_field	CTRL+c		# Pressing CTRL key down, sends string "c" and then releases CTRL key.																																											
<i>Press Keys</i>	button	RETURN		# Pressing "ENTER" key to element.																																											
Radio Button Should Be Set To	group_name, value	<p>Verifies radio button group <code>group_name</code> is set to <code>value</code>.</p> <p><code>group_name</code> is the <code>name</code> of the radio button group.</p>																																													
Radio Button Should Not Be Selected	group_name	<p>Verifies radio button group <code>group_name</code> has no selection.</p> <p><code>group_name</code> is the <code>name</code> of the radio button group.</p>																																													
Register Keyword To Run On Failure	keyword	<p>Sets the keyword to execute, when a SeleniumLibrary keyword fails.</p> <p><code>keyword</code> is the name of a keyword that will be executed if a SeleniumLibrary keyword fails. It is possible to use any available keyword, including user keywords or keywords from other libraries, but the keyword must not take any arguments.</p> <p>The initial keyword to use is set when <i>importing</i> the library, and the keyword that is used by default is <i>Capture Page Screenshot</i>. Taking a screenshot when something failed is a very useful feature, but notice that it can slow down the execution.</p> <p>It is possible to use string <code>NOTHING</code> or <code>NONE</code>, case-insensitively, as well as Python <code>None</code> to disable this feature altogether.</p> <p>This keyword returns the name of the previously registered failure keyword or Python <code>None</code> if this functionality was previously disabled. The return value can be always used to restore the original value later.</p> <p>Example:</p> <table><tr><td><i>Register Keyword To Run On Failure</i></td><td>Log Source</td><td></td></tr><tr><td>\${previous kw}=</td><td><i>Register Keyword To Run On Failure</i></td><td>NONE</td></tr><tr><td><i>Register Keyword To Run On Failure</i></td><td>\${previous kw}</td><td></td></tr></table> <p>Changes in SeleniumLibrary 3.0:</p> <ul style="list-style-type: none">Possible to use string <code>NONE</code> or Python <code>None</code> to disable the functionality.Return Python <code>None</code> when the functionality was disabled earlier. In previous versions special value <code>No Keyword</code> was returned and it could not be used to restore the original state.	<i>Register Keyword To Run On Failure</i>	Log Source		\${previous kw}=	<i>Register Keyword To Run On Failure</i>	NONE	<i>Register Keyword To Run On Failure</i>	\${previous kw}																																					
<i>Register Keyword To Run On Failure</i>	Log Source																																														
\${previous kw}=	<i>Register Keyword To Run On Failure</i>	NONE																																													
<i>Register Keyword To Run On Failure</i>	\${previous kw}																																														
Reload Page		Simulates user reloading page.																																													
Remove Location Strategy	strategy_name	<p>Removes a previously added custom location strategy.</p> <p>See <i>Custom locators</i> for information on how to create and use custom strategies.</p>																																													
Scroll Element Into View	locator	<p>Scrolls the element identified by <code>locator</code> into view.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>New in SeleniumLibrary 3.2.0</p>																																													
Select All From List	locator	<p>Selects all options from multi-selection list <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																																													
Select Checkbox	locator	<p>Selects the checkbox identified by <code>locator</code>.</p> <p>Does nothing if checkbox is already selected.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																																													
Select Frame	locator	<p>Sets frame identified by <code>locator</code> as the current frame.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																																													

		<p>Works both with frames and iframes. Use <i>Unselect Frame</i> to cancel the frame selection and return to the main frame.</p> <p>Example:</p> <table><tr><td><i>Select Frame</i></td><td>top-frame</td><td># Select frame with id or name 'top-frame'</td></tr><tr><td><i>Click Link</i></td><td>example</td><td># Click link 'example' in the selected frame</td></tr><tr><td><i>Unselect Frame</i></td><td></td><td># Back to main frame.</td></tr><tr><td><i>Select Frame</i></td><td colspan="2">//iframe[@name='xxx'] # Select frame using xpath</td></tr></table>	<i>Select Frame</i>	top-frame	# Select frame with id or name 'top-frame'	<i>Click Link</i>	example	# Click link 'example' in the selected frame	<i>Unselect Frame</i>		# Back to main frame.	<i>Select Frame</i>	//iframe[@name='xxx'] # Select frame using xpath	
<i>Select Frame</i>	top-frame	# Select frame with id or name 'top-frame'												
<i>Click Link</i>	example	# Click link 'example' in the selected frame												
<i>Unselect Frame</i>		# Back to main frame.												
<i>Select Frame</i>	//iframe[@name='xxx'] # Select frame using xpath													
Select From List By Index	locator, *indexes	<p>Selects options from selection list <code>locator</code> by <code>indexes</code>.</p> <p>Indexes of list options start from 0.</p> <p>If more than one option is given for a single-selection list, the last value will be selected. With multi-selection lists all specified options are selected, but possible old selections are not cleared.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>												
Select From List By Label	locator, *labels	<p>Selects options from selection list <code>locator</code> by <code>labels</code>.</p> <p>If more than one option is given for a single-selection list, the last value will be selected. With multi-selection lists all specified options are selected, but possible old selections are not cleared.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>												
Select From List By Value	locator, *values	<p>Selects options from selection list <code>locator</code> by <code>values</code>.</p> <p>If more than one option is given for a single-selection list, the last value will be selected. With multi-selection lists all specified options are selected, but possible old selections are not cleared.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>												
Select Radio Button	group_name, value	<p>Sets the radio button group <code>group_name</code> to <code>value</code>.</p> <p>The radio button to be selected is located by two arguments:</p> <ul style="list-style-type: none"><code>group_name</code> is the name of the radio button group.<code>value</code> is the <code>id</code> or <code>value</code> attribute of the actual radio button. <p>Examples:</p> <table><tr><td><i>Select Radio Button</i></td><td>size</td><td>XL</td></tr><tr><td><i>Select Radio Button</i></td><td>contact</td><td>email</td></tr></table>	<i>Select Radio Button</i>	size	XL	<i>Select Radio Button</i>	contact	email						
<i>Select Radio Button</i>	size	XL												
<i>Select Radio Button</i>	contact	email												
Select Window	locator=MAIN, timeout=None	DEPRECATED in SeleniumLibrary 4.0. , use <i>Switch Window</i> instead.												
Set Browser Implicit Wait	value	<p>Sets the implicit wait value used by Selenium.</p> <p>Same as <i>Set Selenium Implicit Wait</i> but only affects the current browser.</p>												
Set Focus To Element	locator	<p>Sets the focus to the element identified by <code>locator</code>.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>Prior to SeleniumLibrary 3.0 this keyword was named <i>Focus</i>.</p>												
Set Screenshot Directory	path	<p>Sets the directory for captured screenshots.</p> <p><code>path</code> argument specifies the absolute path to a directory where the screenshots should be written to. If the directory does not exist, it will be created. The directory can also be set when <i>importing</i> the library. If it is not configured anywhere, screenshots are saved to the same directory where Robot Framework's log file is written.</p> <p>If <code>path</code> equals to EMBED (case insensitive) and <i>Capture Page Screenshot</i> or <i>capture Element Screenshot</i> keywords filename argument is not changed from the default value, then the page or element screenshot is embedded as Base64 image to the log.html.</p> <p>The previous value is returned and can be used to restore the original value later if needed.</p> <p>Returning the previous value is new in SeleniumLibrary 3.0. The persist argument was removed in SeleniumLibrary 3.2 and EMBED is new in SeleniumLibrary 4.2.</p>												
Set Selenium Implicit Wait	value	<p>Sets the implicit wait value used by Selenium.</p> <p>The value can be given as a number that is considered to be seconds or as a human-readable string like <code>1 second</code>. The previous value is returned and can be used to restore the original value later if needed.</p> <p>This keyword sets the implicit wait for all opened browsers. Use <i>Set Browser Implicit Wait</i> to set it only to the current browser.</p> <p>See the <i>Implicit wait</i> section above for more information.</p> <p>Example:</p> <table><tr><td colspan="2">\${orig wait} =</td><td><i>Set Selenium Implicit Wait</i></td><td>10 seconds</td></tr><tr><td colspan="2"><i>Perform AJAX call that is slow</i></td><td></td><td></td></tr><tr><td><i>Set Selenium Implicit Wait</i></td><td colspan="2">\${orig wait}</td><td></td></tr></table>	\${orig wait} =		<i>Set Selenium Implicit Wait</i>	10 seconds	<i>Perform AJAX call that is slow</i>				<i>Set Selenium Implicit Wait</i>	\${orig wait}		
\${orig wait} =		<i>Set Selenium Implicit Wait</i>	10 seconds											
<i>Perform AJAX call that is slow</i>														
<i>Set Selenium Implicit Wait</i>	\${orig wait}													
Set Selenium Speed	value	<p>Sets the delay that is waited after each Selenium command.</p> <p>The value can be given as a number that is considered to be seconds or as a human-readable string like <code>1 second</code>. The previous value is returned and can be used to restore the original value later if needed.</p> <p>See the <i>Selenium Speed</i> section above for more information.</p> <p>Example:</p> <table><tr><td><i>Set Selenium Speed</i></td><td>0.5 seconds</td></tr></table>	<i>Set Selenium Speed</i>	0.5 seconds										
<i>Set Selenium Speed</i>	0.5 seconds													
Set Selenium Timeout	value	<p>Sets the timeout that is used by various keywords.</p> <p>The value can be given as a number that is considered to be seconds or as a human-readable string like <code>1 second</code>. The previous value is returned and can be used to restore the original value later if needed.</p> <p>See the <i>Timeout</i> section above for more information.</p> <p>Example:</p> <table><tr><td colspan="2">\${orig timeout} =</td><td><i>Set Selenium Timeout</i></td><td>15 seconds</td></tr><tr><td colspan="2"><i>Open page that loads slowly</i></td><td></td><td></td></tr></table>	\${orig timeout} =		<i>Set Selenium Timeout</i>	15 seconds	<i>Open page that loads slowly</i>							
\${orig timeout} =		<i>Set Selenium Timeout</i>	15 seconds											
<i>Open page that loads slowly</i>														

		<div>Set Selenium Timeout</div> <div>\$(orig timeout)</div> <div></div>																																				
Set Window Position	x, y	<p>Sets window position using <code>x</code> and <code>y</code> coordinates.</p> <p>The position is relative to the top left corner of the screen, but some browsers exclude possible task bar set by the operating system from the calculation. The actual position may thus be different with different browsers.</p> <p>Values can be given using strings containing numbers or by using actual numbers. See also <i>Get Window Position</i>.</p> <p>Example:</p> <div>Set Window Position100200</div>																																				
Set Window Size	width, height, inner=False	<p>Sets current windows size to given <code>width</code> and <code>height</code>.</p> <p>Values can be given using strings containing numbers or by using actual numbers. See also <i>Get Window Size</i>.</p> <p>Browsers have a limit on their minimum size. Trying to set them smaller will cause the actual size to be bigger than the requested size.</p> <p>If <code>inner</code> parameter is set to True, keyword sets the necessary window width and height to have the desired HTML DOM <code>window.innerWidth</code> and <code>window.innerHeight</code>. See <i>Boolean arguments</i> for more details on how to set boolean arguments.</p> <p>The <code>inner</code> argument is new since SeleniumLibrary 4.0.</p> <p>This <code>inner</code> argument does not support Frames. If a frame is selected, switch to default before running this.</p> <p>Example:</p> <div>Set Window Size800600 Set Window Size800600True</div>																																				
Simulate Event	locator, event	<p>Simulates <code>event</code> on the element identified by <code>locator</code>.</p> <p>This keyword is useful if element has <code>OnEvent</code> handler that needs to be explicitly invoked.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p> <p>Prior to SeleniumLibrary 3.0 this keyword was named <i>Simulate</i>.</p>																																				
Submit Form	locator=None	<p>Submits a form identified by <code>locator</code>.</p> <p>If <code>locator</code> is not given, first form on the page is submitted.</p> <p>See the <i>Locating elements</i> section for details about the locator syntax.</p>																																				
Switch Browser	index_or_alias	<p>Switches between active browsers using <code>index_or_alias</code>.</p> <p>Indices are returned by the <i>Open Browser</i> keyword and aliases can be given to it explicitly. Indices start from 1.</p> <p>Example:</p> <table><tr><td>Open Browser</td><td>http://google.com</td><td>ff</td><td></td></tr><tr><td>Location Should Be</td><td>http://google.com</td><td></td><td></td></tr><tr><td>Open Browser</td><td>http://yahoo.com</td><td>ie</td><td>alias=second</td></tr><tr><td>Location Should Be</td><td>http://yahoo.com</td><td></td><td></td></tr><tr><td>Switch Browser</td><td>1</td><td># index</td><td></td></tr><tr><td>Page Should Contain</td><td>I'm feeling lucky</td><td></td><td></td></tr><tr><td>Switch Browser</td><td>second</td><td># alias</td><td></td></tr><tr><td>Page Should Contain</td><td>More Yahoo!</td><td></td><td></td></tr><tr><td>Close All Browsers</td><td></td><td></td><td></td></tr></table> <p>Above example expects that there was no other open browsers when opening the first one because it used index 1 when switching to it later. If you are not sure about that, you can store the index into a variable as below.</p> <div>\$(index) =Open Browserhttp://google.com # Do something ... Switch Browser\$(index)</div>	Open Browser	http://google.com	ff		Location Should Be	http://google.com			Open Browser	http://yahoo.com	ie	alias=second	Location Should Be	http://yahoo.com			Switch Browser	1	# index		Page Should Contain	I'm feeling lucky			Switch Browser	second	# alias		Page Should Contain	More Yahoo!			Close All Browsers			
Open Browser	http://google.com	ff																																				
Location Should Be	http://google.com																																					
Open Browser	http://yahoo.com	ie	alias=second																																			
Location Should Be	http://yahoo.com																																					
Switch Browser	1	# index																																				
Page Should Contain	I'm feeling lucky																																					
Switch Browser	second	# alias																																				
Page Should Contain	More Yahoo!																																					
Close All Browsers																																						
Switch Window	locator=MAIN, timeout=None, browser=CURRENT	<p>Switches to browser window matching <code>locator</code>.</p> <p>If the window is found, all subsequent commands use the selected window, until this keyword is used again. If the window is not found, this keyword fails. The previous windows handle is returned and can be used to switch back to it later.</p> <p>Notice that alerts should be handled with <i>Handle Alert</i> or other alert related keywords.</p> <p>The <code>locator</code> can be specified using different strategies somewhat similarly as when <i>locating elements</i> on pages.</p> <ul style="list-style-type: none">By default, the <code>locator</code> is matched against window handle, name, title, and URL. Matching is done in that order and the first matching window is selected.The <code>locator</code> can specify an explicit strategy by using the format <code>strategy:value</code> (recommended) or <code>strategy=value</code>. Supported strategies are <code>name</code>, <code>title</code>, and <code>url</code>. These matches windows using their name, title, or URL, respectively. Additionally, <code>default</code> can be used to explicitly use the default strategy explained above.If the <code>locator</code> is <code>NEW</code> (case-insensitive), the latest opened window is selected. It is an error if this is the same as the current window.If the <code>locator</code> is <code>MAIN</code> (default, case-insensitive), the main window is selected.If the <code>locator</code> is <code>CURRENT</code> (case-insensitive), nothing is done. This effectively just returns the current window handle.If the <code>locator</code> is not a string, it is expected to be a list of window handles <i>to exclude</i>. Such a list of excluded windows can be got from <i>Get Window Handles</i> before doing an action that opens a new window. <p>The <code>timeout</code> is used to specify how long keyword will poll to select the new window. The <code>timeout</code> is new in SeleniumLibrary 3.2.</p> <p>Example:</p> <table><tr><td>Click Link</td><td>popup1</td><td></td><td># Open new window</td></tr><tr><td>Switch Window</td><td>example</td><td></td><td># Select window using default strategy</td></tr><tr><td>Title Should Be</td><td>Pop-up 1</td><td></td><td></td></tr></table>	Click Link	popup1		# Open new window	Switch Window	example		# Select window using default strategy	Title Should Be	Pop-up 1																										
Click Link	popup1		# Open new window																																			
Switch Window	example		# Select window using default strategy																																			
Title Should Be	Pop-up 1																																					

		<table><tr><td>Click Button</td><td>popup2</td><td></td><td># Open another window</td></tr><tr><td><code>\$(handle) =</code></td><td>Switch Window</td><td>NEW</td><td># Select latest opened window</td></tr><tr><td>Title Should Be</td><td>Pop-up 2</td><td></td><td></td></tr><tr><td>Switch Window</td><td><code>\$(handle)</code></td><td></td><td># Select window using handle</td></tr><tr><td>Title Should Be</td><td>Pop-up 1</td><td></td><td></td></tr><tr><td>Switch Window</td><td>MAIN</td><td></td><td># Select the main window</td></tr><tr><td>Title Should Be</td><td>Main</td><td></td><td></td></tr><tr><td><code>\$(excludes) =</code></td><td>Get Window Handles</td><td></td><td># Get list of current windows</td></tr><tr><td>Click Link</td><td>popup3</td><td></td><td># Open one more window</td></tr><tr><td>Switch Window</td><td><code>\$(excludes)</code></td><td></td><td># Select window using excludes</td></tr><tr><td>Title Should Be</td><td>Pop-up 3</td><td></td><td></td></tr></table> <p>The <code>browser</code> argument allows with <code>index_or_alias</code> to implicitly switch to a specific browser when switching to a window. See Switch Browser</p> <ul style="list-style-type: none">If the <code>browser</code> is <code>CURRENT</code> (case-insensitive), no other browser is selected. <p>NOTE:</p> <ul style="list-style-type: none">The <code>strategy:value</code> syntax is only supported by SeleniumLibrary 3.0 and newer.Prior to SeleniumLibrary 3.0 matching windows by name, title and URL was case-insensitive.Earlier versions supported aliases <code>None</code>, <code>null</code> and the empty string for selecting the main window, and alias <code>self</code> for selecting the current window. Support for these aliases was removed in SeleniumLibrary 3.2.	Click Button	popup2		# Open another window	<code>\$(handle) =</code>	Switch Window	NEW	# Select latest opened window	Title Should Be	Pop-up 2			Switch Window	<code>\$(handle)</code>		# Select window using handle	Title Should Be	Pop-up 1			Switch Window	MAIN		# Select the main window	Title Should Be	Main			<code>\$(excludes) =</code>	Get Window Handles		# Get list of current windows	Click Link	popup3		# Open one more window	Switch Window	<code>\$(excludes)</code>		# Select window using excludes	Title Should Be	Pop-up 3

Switch Window	<code>\$(excludes)</code>		# Select window using excludes																																											
Title Should Be	Pop-up 3																																													
Table Cell Should Contain	<code>locator, row, column, expected, loglevel=TRACE</code>	Verifies table cell contains text <code>expected</code> . See Get Table Cell that this keyword uses internally for an explanation about accepted arguments.																																												
Table Column Should Contain	<code>locator, column, expected, loglevel=TRACE</code>	Verifies table column contains text <code>expected</code> . The table is located using the <code>locator</code> argument and its column found using <code>column</code> . See the Locating elements section for details about the locator syntax. Column indexes start from 1. It is possible to refer to columns from the end by using negative indexes so that -1 is the last column, -2 is the second last, and so on. If a table contains cells that span multiple columns, those merged cells count as a single column. See Page Should Contain Element for an explanation about the <code>loglevel</code> argument.																																												
Table Footer Should Contain	<code>locator, expected, loglevel=TRACE</code>	Verifies table footer contains text <code>expected</code> . Any <code><td></code> element inside <code><tfoot></code> element is considered to be part of the footer. The table is located using the <code>locator</code> argument. See the Locating elements section for details about the locator syntax. See Page Should Contain Element for an explanation about the <code>loglevel</code> argument.																																												
Table Header Should Contain	<code>locator, expected, loglevel=TRACE</code>	Verifies table header contains text <code>expected</code> . Any <code><th></code> element anywhere in the table is considered to be part of the header. The table is located using the <code>locator</code> argument. See the Locating elements section for details about the locator syntax. See Page Should Contain Element for an explanation about the <code>loglevel</code> argument.																																												
Table Row Should Contain	<code>locator, row, expected, loglevel=TRACE</code>	Verifies that table row contains text <code>expected</code> . The table is located using the <code>locator</code> argument and its column found using <code>column</code> . See the Locating elements section for details about the locator syntax. Row indexes start from 1. It is possible to refer to rows from the end by using negative indexes so that -1 is the last row, -2 is the second last, and so on. If a table contains cells that span multiple rows, a match only occurs for the uppermost row of those merged cells. See Page Should Contain Element for an explanation about the <code>loglevel</code> argument.																																												
Table Should Contain	<code>locator, expected, loglevel=TRACE</code>	Verifies table contains text <code>expected</code> . The table is located using the <code>locator</code> argument. See the Locating elements section for details about the locator syntax. See Page Should Contain Element for an explanation about the <code>loglevel</code> argument.																																												
Textarea Should Contain	<code>locator, expected, message=None</code>	Verifies text area <code>locator</code> contains text <code>expected</code> . <code>message</code> can be used to override default error message. See the Locating elements section for details about the locator syntax.																																												
Textarea Value Should Be	<code>locator, expected, message=None</code>	Verifies text area <code>locator</code> has exactly text <code>expected</code> . <code>message</code> can be used to override default error message. See the Locating elements section for details about the locator syntax.																																												
Textfield Should Contain	<code>locator, expected, message=None</code>	Verifies text field <code>locator</code> contains text <code>expected</code> . <code>message</code> can be used to override the default error message. See the Locating elements section for details about the locator syntax.																																												
Textfield Value Should Be	<code>locator, expected, message=None</code>	Verifies text field <code>locator</code> has exactly text <code>expected</code> . <code>message</code> can be used to override default error message. See the Locating elements section for details about the locator syntax.																																												
Title Should Be	<code>title, message=None</code>	Verifies that the current page title equals <code>title</code> . The <code>message</code> argument can be used to override the default error message. <code>message</code> argument is new in SeleniumLibrary 3.1.																																												
Unselect All From	<code>locator</code>	Unselects all options from multi-selection list <code>locator</code> .																																												

List		See the Locating elements section for details about the locator syntax. New in SeleniumLibrary 3.0.						
Unselect Checkbox	<i>locator</i>	Removes the selection of checkbox identified by <code>locator</code> . Does nothing if the checkbox is not selected. See the Locating elements section for details about the locator syntax.						
Unselect Frame		Sets the main frame as the current frame. In practice cancels the previous Select Frame call.						
Unselect From List By Index	<i>locator, *indexes</i>	Unselects options from selection list <code>locator</code> by <code>indexes</code> . Indexes of list options start from 0. This keyword works only with multi-selection lists. See the Locating elements section for details about the locator syntax.						
Unselect From List By Label	<i>locator, *labels</i>	Unselects options from selection list <code>locator</code> by <code>labels</code> . This keyword works only with multi-selection lists. See the Locating elements section for details about the locator syntax.						
Unselect From List By Value	<i>locator, *values</i>	Unselects options from selection list <code>locator</code> by <code>values</code> . This keyword works only with multi-selection lists. See the Locating elements section for details about the locator syntax.						
Wait For Condition	<i>condition, timeout=None, error=None</i>	Waits until <code>condition</code> is true or <code>timeout</code> expires. The condition can be arbitrary JavaScript expression but it must return a value to be evaluated. See Execute JavaScript for information about accessing content on pages. Fails if the timeout expires before the condition becomes true. See the Timeouts section for more information about using timeouts and their default value. <code>error</code> can be used to override the default error message. Examples: <table><tr><td>Wait For Condition</td><td>return document.title == "New Title"</td></tr><tr><td>Wait For Condition</td><td>return jQuery.active == 0</td></tr><tr><td>Wait For Condition</td><td>style = document.querySelector('h1').style; return style.background == "red" && style.color == "white"</td></tr></table>	Wait For Condition	return document.title == "New Title"	Wait For Condition	return jQuery.active == 0	Wait For Condition	style = document.querySelector('h1').style; return style.background == "red" && style.color == "white"
Wait For Condition	return document.title == "New Title"							
Wait For Condition	return jQuery.active == 0							
Wait For Condition	style = document.querySelector('h1').style; return style.background == "red" && style.color == "white"							
Wait Until Element Contains	<i>locator, text, timeout=None, error=None</i>	Waits until the element <code>locator</code> contains <code>text</code> . Fails if <code>timeout</code> expires before the text appears. See the Timeouts section for more information about using timeouts and their default value and the Locating elements section for details about the locator syntax. <code>error</code> can be used to override the default error message.						
Wait Until Element Does Not Contain	<i>locator, text, timeout=None, error=None</i>	Waits until the element <code>locator</code> does not contain <code>text</code> . Fails if <code>timeout</code> expires before the text disappears. See the Timeouts section for more information about using timeouts and their default value and the Locating elements section for details about the locator syntax. <code>error</code> can be used to override the default error message.						
Wait Until Element Is Enabled	<i>locator, timeout=None, error=None</i>	Waits until the element <code>locator</code> is enabled. Element is considered enabled if it is not disabled nor read-only. Fails if <code>timeout</code> expires before the element is enabled. See the Timeouts section for more information about using timeouts and their default value and the Locating elements section for details about the locator syntax. <code>error</code> can be used to override the default error message. Considering read-only elements to be disabled is a new feature in SeleniumLibrary 3.0.						
Wait Until Element Is Not Visible	<i>locator, timeout=None, error=None</i>	Waits until the element <code>locator</code> is not visible. Fails if <code>timeout</code> expires before the element is not visible. See the Timeouts section for more information about using timeouts and their default value and the Locating elements section for details about the locator syntax. <code>error</code> can be used to override the default error message.						
Wait Until Element Is Visible	<i>locator, timeout=None, error=None</i>	Waits until the element <code>locator</code> is visible. Fails if <code>timeout</code> expires before the element is visible. See the Timeouts section for more information about using timeouts and their default value and the Locating elements section for details about the locator syntax. <code>error</code> can be used to override the default error message.						
Wait Until Location Contains	<i>expected, timeout=None, message=None</i>	Waits until the current URL contains <code>expected</code> . The <code>expected</code> argument contains the expected value in url. Fails if <code>timeout</code> expires before the location contains. See the Timeouts section for more information about using timeouts and their default value. The <code>message</code> argument can be used to override the default error message. New in SeleniumLibrary 4.0						
Wait Until Location Does Not Contain	<i>location, timeout=None, message=None</i>	Waits until the current URL does not contains <code>location</code> . The <code>location</code> argument contains value not expected in url. Fails if <code>timeout</code> expires before the location not contains. See the Timeouts section for more information about using timeouts and their default value. The <code>message</code> argument can be used to override the default error message. New in SeleniumLibrary 4.3						

Wait Until Location Is	<i>expected, timeout=None, message=None</i>	<p>Waits until the current URL is <code>expected</code>.</p> <p>The <code>expected</code> argument is the expected value in url.</p> <p>Fails if <code>timeout</code> expires before the location is. See the <i>Timeouts</i> section for more information about using timeouts and their default value.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p>New in SeleniumLibrary 4.0</p>
Wait Until Location Is Not	<i>location, timeout=None, message=None</i>	<p>Waits until the current URL is not <code>location</code>.</p> <p>The <code>location</code> argument is the unexpected value in url.</p> <p>Fails if <code>timeout</code> expires before the location is not. See the <i>Timeouts</i> section for more information about using timeouts and their default value.</p> <p>The <code>message</code> argument can be used to override the default error message.</p> <p>New in SeleniumLibrary 4.3</p>
Wait Until Page Contains	<i>text, timeout=None, error=None</i>	<p>Waits until <code>text</code> appears on the current page.</p> <p>Fails if <code>timeout</code> expires before the text appears. See the <i>Timeouts</i> section for more information about using timeouts and their default value.</p> <p><code>error</code> can be used to override the default error message.</p>
Wait Until Page Contains Element	<i>locator, timeout=None, error=None, limit=None</i>	<p>Waits until the element <code>locator</code> appears on the current page.</p> <p>Fails if <code>timeout</code> expires before the element appears. See the <i>Timeouts</i> section for more information about using timeouts and their default value and the <i>Locating elements</i> section for details about the locator syntax.</p> <p><code>error</code> can be used to override the default error message.</p> <p>The <code>limit</code> argument can used to define how many elements the page should contain. When <code>limit</code> is <i>None</i> (default) page can contain one or more elements. When limit is a number, page must contain same number of elements.</p> <p><code>limit</code> is new in SeleniumLibrary 4.4</p>
Wait Until Page Does Not Contain	<i>text, timeout=None, error=None</i>	<p>Waits until <code>text</code> disappears from the current page.</p> <p>Fails if <code>timeout</code> expires before the text disappears. See the <i>Timeouts</i> section for more information about using timeouts and their default value.</p> <p><code>error</code> can be used to override the default error message.</p>
Wait Until Page Does Not Contain Element	<i>locator, timeout=None, error=None, limit=None</i>	<p>Waits until the element <code>locator</code> disappears from the current page.</p> <p>Fails if <code>timeout</code> expires before the element disappears. See the <i>Timeouts</i> section for more information about using timeouts and their default value and the <i>Locating elements</i> section for details about the locator syntax.</p> <p><code>error</code> can be used to override the default error message.</p> <p>The <code>limit</code> argument can used to define how many elements the page should not contain. When <code>limit</code> is <i>None</i> (default) page can't contain any elements. When limit is a number, page must not contain same number of elements.</p> <p><code>limit</code> is new in SeleniumLibrary 4.4</p>

Altogether 175 keywords.
